1581. Collapsable antenna sources sought

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-06-24 04:23:53 UTC
From: tew+@cs.cmu.edu
Message-ID: <2udn4p$oaj@casaba.srv.cs.cmu.edu>
Source record: 117321
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew

I'm looking for a source of collapsable antennas approximately 40-50" long extended, about 5"-7" long collapsed, such as might be found on a small walkie-talkie or transistor radio.

Radio Shack sells a decent assortment, but all their longer antennas are 8-12" long when collapsed, and their small collapsed antennas are under 24" long when extended.

Anyone know where I could find an assortment of different sized collapsable antennas? Neither Allied Electronics nor Quement nor Digikey nor Jameco nor Unicorn nor JDR seem to carry them, nor do surplus dealers such as Marlin P. Jones, nor Hosfelt, nor Fair Radio Sales.

I'm trying to beef up the antenna on a Radio Shack FM walkie-talkie that I've retuned for 6 meters (this is the small, single-channel crystal-based one). I'd rather increase my antenna length (and radiate more signal horizontally) than simply boost the power output since the batteries in those things are so small.

Any ideas?

1585. Newcomer to Radio looking for advice

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-06-24 15:03:47 UTC
From: rhofmann@nynexst.com
Message-ID: <2ueskj$h23@news.nynexst.com>
Source record: 117326

Hi everyone. I'm a newcomer to the world of home-built transmitters/receivers and I have a few things I'd like to ask of the collective net-wisdom. My interest in this group stems from the desire, as sort of a summer project perhaps, to build some sort of a short range transmitter/receiver that I could perhaps use to link 2 computers together at school via a null modem type connection perhaps. I don't have very much experience with radio in particular, but I will be going into my senior year as a physics major and I have had at least an overview of electronic devices and circuits. What I'm wondering is:

- Is this a feasible project to undertake?
- If so, where might I find plans/designs to work off of in constructing such a device?
- What frequency bands if any would I legally be able to make use of?
- What frequency bands and how much power would I need in order to transmit reliably within a dormitory for example (cinder block walls, max distance of maybe 500 feet)

Any information that might help would be appreciated. Reply via postings or email.

Mike,

You might be interested in the 1010 MHz coaxial/troughline oscillator
I showed in my microwave station design series in Feb/Jun/Oct 1988
Ham Radio Magazine. Although the series describes construction of the
halfwave line version, I also refer to a quarterwave line version which
is very similar. This allows mechanical tuning with a telescoping center
conductor made from hobby store brass tubing and the ones I built would
tune from .8 to 1.2 GHz or more. This oscillator provides low phasse noise
along with wide (mechanical) tuning range. If you are looking for multiple
precision oscillators, you might easily build several of these and lock
each to a different line of a 50 MHz reference as the articles shows (using
a 100 MHz phaslocked VCXO).

I used the phaselocked 1010 MHz oscillator to in turn lock up a 10100 MHz
oscillator for 10,368 MHz SSB. The resulting performance and phase noise
was quite acceptable and is also shown in the series.

AU>changing the crystal and antenna to the frequency I want. Please do not

Legally, yes. Easily, no. You're looking at moving a cheap
piece of equipment almost 400 MHz. That's akin to converting
a Radio Shack Flavoradio to pick up TV.

Say you spend $20 for a pair of those units. Figure on spending
at least another $50-$100 in attempting to convert them over.
Then look at Ramsey's catalog -- a five-watt, 12-channel 440 MHz
unit for $149.95 (less case).

I've heard of people moving those units up to 6 meters with varying
degrees of success, though.

The best I've heard is some guy who mounted one up on a tower and
operated it by remote control with his shack. He had worked
six states when I read the article.

```

If you know how to get in touch with the International Radio Club
of America (IRCA), they had a group of members who did something
similar back in the mid 70s. They would get really good
accuracy, often to the point of being able to ID a station
simply by its frequency. IRCA has a reprint service, and that
info should be available. I don't have their address, but it
should be in the WRTH.

Those kits are from Ramsey Electronics. The performance of the completed
kits is, ummm, less than optimal. For example, when QST reviewed the 2m
xcvr they found that the transmitter did not meet FCC spurious emission
specifications. You get what you pay for....

VHF/UHF Handbook, by Jessop, has a good description of helical
filter design; the ARRL Handbook also has a section on them.
Zverev's classic filter design book has a very interesting
chapter on resonators of various sorts, including helicals
at VHF and HF.

I recently ran across a book, whose title escapes me (from
Artech House?), specifically about helical filters and how
to avoid 3\lambda/4 spurs and other annoyances. The author
advocates using a coil with a sense reversal partway along it.

I've been trying to get the shareware PADS to bring all grounds in my circuit into a single point, without success. I don't seem to have any control over which pins have the physical connections -- I can connect all grounds to a single point on the schematic, but when it's imported into PADS-PCB, that information is lost and PADS re-connects the pins in a daisy-chain format.

Any suggestions?

1595. HELP: Audio problems in Yaesu FT727R HT

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-06-26 21:54:56 UTC
From: moisan@bronze.lcs.mit.edu
Message-ID: <2uktfg$ctf@bronze.lcs.mit.edu>
Source record: 117335

I've a problem with a Yaesu FT727R HT I recently brought back to service. It has intermittently lost its audio. When I first turned it on after repairs, the radio made a brief motorboating sound, then the audio seems to cut out (radio CPU still works and the Busy light still indicates open squelch). There *is* audio when this happens, but it's *very* faint. There is a tone board (Yaesu's) installed, and it is also nonfunctional (radio just beeps when I try to invoke the encoder).

The first time this happened, I was able to turn the radio off and on and normal audio would come back (tone board still didn't work). Now after several hours of this, the audio does *not* return.

A month ago, I experienced these symptoms and replaced the audio output transistor, a 2SB772; a new transistor is in place now, but the problem persists. I have a thought that perhaps the fault is killing the transistor; I hope not. The tone card might be squelching the audio, since it supports tone decode as well as encode.

This is an old HT, and has been under repair several times. I'm reaching the point of no return, but would really appreciate any advice on this, especially from 727 owners (_besides_ "Buy a new radio!" :)).

Thanks and 73's, Dave, N1KGH

You will have to hand route your ground traces. The trick is
that you must run one ground trace over top of other ground traces.
The copper will be correct but your layout under PADS will be more
complex. What you must do is to first route the trace from the
circuit ground point to the common ground point. Next, continue
from the common ground point to the point that PADS connected the
ground. This will complete the routing and make PADS happy. The
trace should be routed on top of the previous trace going to that
circuit ground.
How you draw the circuit has no bearing on how the netlist is
created. The netlist is only electrically correct. It is only
the netlist that controls how the routes are run.
Pete.

>---
>Arthur Chien

Info on this type of filter is somewhat hard to find but I have spent *more* than a little time searching so I think I can save you some time. Got a pen ?

As usual, the ARRL handbook touches on the subject.
Handbook of Filter Synthesis, A.I. Zverev ISBN 0-471-98680-1
Reference Data for Radio Engineers, Howard Sams (pre-seventh edition)
Filters with Helical and Folded Helical Resonators, Peter Vismueller
ISBN 0-89006-244-7.

There are a few more but these are the most common and should get you started. BTW, the Zverev is out of print and is hard to find except in the reference section of an engineering library (the copy at my library has been stolen by some unscroupulous filter engineer). The Vismueller book *JUST* went out of print a couple of weeks ago; at that time, the publishers had 2 copies left which go for a hefty price (something like $70 CDN -Yeowch!).

-Good luck

I'm don't remember what the PRO-2023 was, if it is one of their programmable
scanners it is very unlikely that you can mod it to do anything.
They are controlled by a microprocessor that has the PLL frequency
generator built in. You would have to reprogram the microprocessor
to be able to make it scan other bands. The receiver itself would
have no problem with 6 meters but 10 might be a little out of its range.
If it is one of their (RS) crystal controlled units you should have no
problem with the mod, although 10 meters might be a little much to ask for
but 6 should be no problem.

(A thousand apologies if this post is grossly off-charter
for this newsgroup, but this group is the best I could
find for this question.)

I have an old Black and Decker electric lawn mower that
I recently repaired. It's all up and running, except that
there is a large (5 ohm, 20 watt, I believe) block-shaped
resistor that I need to re-attach to the side of the motor
housing. It was originally attached with an off-white,
rubbery adhesive. This adhesive isn't silicone or RTV. From
my former life as an electronics technician (MANY years ago),
I vaguely remember something called (I think) potting compound
that was used for this purpose. As I recall, this stuff not
only had adhesive properties but also could help act as a
heat sink. (Note that I'm NOT talking about the greasy, white
heat sink stuff you use when mounting such things as power
transistors.)

So, if you have any idea what it is I need to get, or if you
can tell me that it's OK to use silicone caulk or RTV as a
substitute, please let me know.

Much thanks in advance.

We used a ground plane instead of a point. It is the usual practice for
RF circuits. Double sided PCB's were used in our design. The ground
plane was created by copper pour in the final stage of the layout. We
always routed the PCB manually by the RF engineers. This approach works
very well.

Hi All

The Vismueller book does actully have some pratical sections, as opposed to most of my engineering texts. Glad we have Zverev already.

Don't forget the interlibrary loan option. I have yet to find a book I couldn't get for a couple of weeks. Usually at little or no charge.

Ask at the reference desk in your local library.

I keep looking at that Uniden 2600 with the blown final transistor...
..and I keep thinking: "How tough would it be to convert this muther
to 6 meters?" Well...let's see..a new display table in the uP's rom
so it would read "50-54" instead of "26-30", a new LO, a new mixer,
maybe keep the IF's as is...modify the mixers a bit, a new final..
..some osc in the receiver?...Hmmm??

On the other hand, why can't Uniden BUILD a 6m version of this rig??
(It cant be any more expensive than the 10m ones, 2510, 2600, 2950 etc)
..as an aside, is anyone from Uniden on the net? Are you listening? ;-)

It just KILLS me that Yaesu wants >$450 for their 6m all-mode!

SUBJECT: AUTHOR INFORMATION FOR THE PROCEEDINGS of the
20th ANNUAL EASTERN VHF/UHF CONFERENCE

Dear contributor;

The 20th Annual Eastern VHF/UHF Conference this year will be held at the Quality Inn And Conference Center, in Vernon CT, on August 26, 27, and 28, 1994.

Again this year we are going to publish a proceedings of the conference in conjunction with the ARRL. There are some noted authors again this year. If you have anything that you wish to contribute for the proceedings we need to receive this material by July 22, 1994. Please make the material "ready for press" quality, due to the time allotted, we cannot rework the material. Photographs are reproducible (black&white is better than color, but color is OK too) and their mounting position needs to be identified on an 8 1/2 x 11 page leaving a 1" margin on all sides. (Draw boxes with words such as Photo 1 within. Label the backs of the photographs with Photo 1, etc. using a permanent marker. Captions may be typed above or below the photo outline). Text should be presented with the same margin if possible. All material for the proceedings should be forwarded to Ron, WZ1V.

If you wish to transmit anything electronically, use:
Internet Email: klimas%uhavax.dnet@ipgate.hartford.edu
I can handle UUEncoded or XXEncoded archived files as well.
I prefer archives in ZIP, ARC, ARJ, or LZH formats, but can handle others.
I prefer Text in plain Ascii. (but Works or WordPerfect is ok).
I prefer graphics in PCX or GIF format, but can convert most others.
You may also send articles in on disk this way. (PC only, don't have a Mac) or upload them to my BBS at 203-768-4758 anytime after 4pm EST.

If you have any other questions concerning the conference please don't hesitate to contact us. Again, thank you for your support to make this years' conference better than ever.

Thank You and 73's,

Stan Hilinski, KA1ZE Ron Klimas, WZ1V

1614. CW Timings

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-06-29 16:30:33 UTC
From: fax@sparc4.Ico.Olivetti.COM
Message-ID: <9406291630.AA25658@sparc4.ICO.OLIVETTI.COM>
Source record: 117352

Hi all,
I've built a keyer with a LCD that should indicate the current keying speed
but I'm having trouble to tune it to show the *real* speed in WPM.
I tried to use the following proceeding assuming 'PARIS' as the standard
word for my calculations :

1 word = 50 dots (including 1 dot for dot/dash separation, 3 dots
inter-character separation and 7 dots inter-word separation)

Dot time = 60 / (50 * WPM)

So, supposing a speed of 20 wpm, I end up with a dot time of 60 msec
which is fairly slower than SuperMorse. I know that some cw programs use
the farsnworth method but SM should not use it if the the speed params show the
same value.
Does anyone know the correct formula?

Thanks much

I use the relationship

dot time (ms) = 1200 / speed (wpm)

which works out to be identical to your formula.
This has given good results for many projects over
the years.

From: chalup@net.bio.net
Message-ID: <2usgpu$h69@net.bio.net>
Source record: 117355

I'm trying to identify some surplus HV vacuum capacitors (both fixed
and variable). All components are from Jennings Radio.

Fixed Capacitor:

Model MC-1-1000 15,000V - Capacitance (uuf)?

Variable Capacitors:

Model UCSL-1000 (CB-144) 3000V - Maximum and minimum capacitance (uuf)?

Model UCSL-750 (CD-150) 5000V - "

Model UCSXF-1200 10,000V - "

Model UCSF-500 - Maximum and minimum capacitance and voltage?

Model UCSL-750 (CD147) - "

So if you have an old Jennings catalog, I'd greatly appreciate the assistance.

TNX!

1622. Inductance of toroids?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-06-30 01:33:24 UTC
From: Mike.Czuhajewski%hambbs@wb3ffv.ampr.org
Message-ID: <1994Jun29.213324.925@wb3ffv.wb3ffv.ampr.org>
Source record: 117361

Does anyone know where I can find the formula for finding the inductance of a toroidal inductor? I do NOT mean the formula which is derived on the published "Al" values, but rather a formula based on the physical measurements such as height, circumferance, etc. (There has been a similar formula for years in the ARRL handbook for solenoidal inductors, but I've never seen one for toroids.)

Part Two--Does anyone know the exact methodology used by the industry

to determine the "Al" value of toroidal forms? Those values are usually specified as microhenries per 100 turns for powdered irons, and millihenries per 1000 turns for ferrites. The question: Do they wind a single turn and extrapolate that, do they wind the 100 or 1000 turns and measure resulting inductance, if they do it that way do they then turn around and calculate the distributed capacitance and factor that out, etc... 73 DE WA8MCQ

This is correct. An often-used equivalent is WPM = 2.4 * DPS (dots per second). Since 1 DPS is 2 dot-times, the formulas are equivalent.
>
>So, supposing a speed of 20 wpm, I end up with a dot time of 60 msec

Your number is correct, so SuperMorse must have a timing error, at least on your computer. How much off is it?

Depends whether it has to pass spectral purity requirements. It
is pretty easy to get mixing spurs -40 dB down. But, for 6 meters,
you need at least -60, which isn't quite as easy. Problem is, it
isn't unusual for some of those spurs to "race across the passband"
as you tune the rig. Thus, no matter how tight your filters, you
might not be able to filter some of them out, unless you don't mind a
rig that doesn't the edges of the band.

It does seem a bit easier to do with a phasing exciter, since the
mixing products can be avoided or reduced.

Yes, a tracking filter might work, except that sharp tracking filters
don't seem to be available on inexpensive radios yet. You can get
them as a feature on radios that cost more than new cars...

: been a similar formula for years in the ARRL handbook for solenoidal
: inductors, but I've never seen one for toroids.)
:
From Terman's "Radio Engineers' Handbook," page 57,

"The low-frequency inductance of a toroidal coil of n turns with a
winding of circular corss section of diameter d and a radius of
revolution D/2 inches, as shown in Fig. 22, is

Lo = 0.01595*n^2*[D-(D^2-d^2)^0.5] microhenrys

For toroidal coils in which the turn diameter is much less than the
toroid diameter (i.e., d<0.1D), the inductance is approximately

Lo = 0.007975*d^2*n^2/D microhenrys

Toroidal coil of rectangular cross section. -- When the axial depth of
the winding is h and the inner and outer diameters d1 and d2 inches,
respectively, as shown in Fig. 23, the low-frequency inductance is

Lo = 0.01170*n^2*h*log(d2/d1) microhenrys. "

(This rather old book is still a good reference for a wide variety of
fundamental information. However, not all the formulas are valid over
as wide a range of parameters as you might hope; many are approximations
that start to fall apart at extremes of the parameters, and often where
those extremes start isn't clearly stated. Still, it's a good starting
point. Note that these formulae are all for air-core coils...)

Where might I find a make-your-own-AM-transmitter kit?
If it is low enough power, the FCC allows transmissions on the AM band, correct?
Would I be able to power it with 6/12 volts? A car lighter?
Thank you...bye

>a single turn and extrapolate that, do they wind the 100 or 1000 turns
>and measure resulting inductance, if they do it that way do they then
>turn around and calculate the distributed capacitance and factor that
>out, etc... 73 DE WA8MCQ

L = (4*10^-9*pi*murel*A/l)*n^2

where

L = inductance in henrys
murel = relative permeability of the core
A = core cross-sectional area in cm^2
l = magnetic path length in cm (typically the average of outer & inner
circum.)
n = number of turns

The 4*pi*10^-9 comes from the value of the permeability of free space, and
the use of cm instead of m for A and l.

The term in parentheses is Al in henrys/turn^2.

Al is measured using a fairly large number of turns, because the formula
doesn't hold for sparse windings, particularly with low-permeability
materials or at frequencies at which permeability is low. This is due to
the fact that with sparse windings, not all the flux from each turn is
coupled to every other turn, resulting in reduced inductance. It's also
typically measured at a sufficiently low frequency that the effect of
capacitance is negligible.

Note that the relative permeability is a function of frequency and of flux
density, so the inductance (and Al value) will change with these parameters.
Also, the permeability actually is a complex quantity, leading to frequency-
and flux density-related loss.

Check out the Phillips (or Signetics) TDA-7000. This chip does most of
the FM receiver chore, but you will need to find another chip to do the
FM decoding.

>-Allan Carhart
>acarhart@netcom.com

Okay...I should be a little more careful with my words, in this group.
I am hoping to build a trasmitter to broadcast on the radio
spectrum, known to laymen as "AM Radio"
in contrast to "FM Radio" --- In the portion of the radio wave
spectrum between 550 KHz and 1600 KHz...I chose AM because I am under
the impression that Amplitude Modulation is a bit easier to pull off than
Frequency Modulation....and currently, I have only an AM radio in my car...
My final goal is to solve the following problem:
Of the three cars my family owns, one only has an AM radio, one has FM/AM,
and one has a tape deck and FM/AM....
I would like to listen to my favorite CD, my favorite tape, or my favorite
FM or AM station in any of the above mentioned vehicles....

I was impressed with the CD-to-tape invention which is now on the market
from Radio Shack, and many other electronics store...(A fake-tape goes in your
tape deck and produces the signals taken from the CD player)

....but then, I thought, WHY stop there???

Why not hook up a CD player (or tape player or even FM radio) to a transmitter,
with the power to only go a few feet...
The device will sit on the passenger's lap, and have enough power to
transmit to the car stereo, sitting in the front of the car.

We will trasmit, let's say on 1590 KHz, and then tune the car's stereo
to 1590....

As long as I keep this extremely low power, (battery operated I hope),
does anyone know if the FCC would complain?
What if I'm stopped in traffic and the car next to me can pick up
my signal? Is That illegal?

Thank you for any help...
and my final note:
Disclaimer: I have the right to ask questions...I hope that this has not
portrayed me as being too ignorant...If I am told that this is against the law,
I have no intention of breaking the law....Please no flames...thank you.

From: shane@mdd.comm.mot.com
Message-ID: <2v2238$ie1@daffyduck.mdd.comm.mot.com>
Source record: 117375

We have a number of 800 and 900 MHz radios here in our lab that are in need of troubleshooting. Does anyone out there have any ideas on constructing a "sniffer" for these frequencies? I was thinking of a *tiny* wire loop that would run into the RF port of a mixer. The LO port would receive fc - 1MHz. The IF would give an envelope capable of display on a scope. Alternatively the wire loop could run directly into a power meter. Put the loop on the end of a plastic probe, place the loop near the signal of interest, watch the display.

Whaddayathink?

I'm old enough to remember when such transmitters were commonly used in household equipment. The 78 rpm record player my family had when I was very young used such a transmitter, you tuned an a.m. receiver to 530 khz. (kc. in those days) and there it was. I know this because by the time I became a teenager I had taken the thing apart for parts for my ham projects.

There are differences between the old 1940's style wireless record players and the situation you describe, however. In the old days tube type equipment all operated from the a.c. power line and the a.m. signal was generally coupled to the power cord, which would then couple the signal to an a.m. radio plugged into the same circuit. For your application you will probably need some kind of antenna. Also, car radios are generally pretty carefully designed with metal cases, bypassed power leads, and shielded leads to the car antenna so that they won't pick up any of the radio noise that is generated by the ignition system and other parts of the car electrical system. You might find it difficult to pick up a signal originating inside the car.

There are cheap wireless microphones sold as toys which work the way you describe. I got one for 50 cents at a neighborhood tag sale. You might look around for a cheap way to test your plan -- give it a try.

It is legal to transmit within the AM broadcast band without a license
as long as you adhere to certain limits on power and antenna. Your
idea sounds perfectly reasonable to me -- you won't have any problem
going a couple of feet with a legal transmitter.

The last time I built one of these, I was in fifth grade, playing with
a Radio Shack electronics kit. There are also designs for simple AM
transmitters in the Radio Shack _Mini Engineer's Notebook_ volume,
"Communications Projects". Finally, Ramsey Electronics and JDR Microdevices
sell at least one AM transmitter kit. The catalog descriptions leave
open the question of whether these kits operate at legal power output.

> What if I'm stopped in traffic and the car next to me can pick up
> my signal? Is That illegal?

Good question. I haven't read Part 15, but it's almost certainly your
responsibility to resolve any interference you cause with the transmitter.
If you want to be sure you're legal, look up 47 CFR 15 and check out the
real rules. (How? Good question. I'd guess a big library, perhaps a
government depository library, would have it.)

Obligatory ham radio: Has anyone built a ham rig from an RS electronics
kit? It would be fun to fill in the eqipment field of a QSL card with,
"RS 75-in-1 Electronics Kit". :-)

No Idea...

: 2. Orange, "331 A1J" on 1 side & "348 RFO" on the other

330 PF 331 means 33 followed by one "0" in PF

: 3. Blue, only has "333" on it

.033 uF This is 33 followed by three "0"s in PF

: 4. Blue, "33J" and "5A"

33 PF A "J" or "K" can be replaced by a decimal point. J and K are
different tolerances (but I forget which is which).

A cap marked 3K3, for example, would be 3.3 PF.

Hope this helps!

1642. Periodic Announcement - ARRL Email Information Server (info@arrl.org)

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-03 03:00:04 UTC
From: mtracy@arrl.org
Message-ID: <rec.radio.info-arrl.email.info_773204402@ve6mgs.ampr.ab.ca>
Source record: 117381
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew,rec.radio.info

Periodic Announcement - ARRL Email Information Server (info@arrl.org)

The services that the ARRL provides via the internet include the
Email Information Server and the Technical Information Service.
The Information Server is an automated mail server that gives you
access to many of information files relating to various facets of
Amateur Radio. You can retrieve any or all of these files by
sending an email message to info@arrl.org here at ARRL HQ.
Each file you request is then mailed to you automatically.

To use it, mail messages to:

info@arrl.org

Each line of the message body should contain a command as shown below.
The subject of your message is not processed and may be omitted. You
may place as many commands in a message as you want. The files you
request will be sent to you in separate messages. Only ASCII text
files are supported.

Valid INFO commands:

reply <address> (may be needed - see below for explanation)
help
index
send FILENAME (example: send prospect.txt)
quit

In the above message example, "help" retrieves a brief set of
instructions for info, "index" retrieves a list of available files
and "send prospect.txt" retrieves a text file containing information
on becoming a radio amateur.

Note to users with FTP capability: All of these files are also
available by anonymous ftp to oak.oakland.edu in the
pub/hamradio/arrl/infoserver area. Retrieve the file index.txt
in the /league sub-directory for a complete listing of available
files.

If you want to retrieve several text files with one message, use a
separate line for each "send filename" request.

Your From: field or Reply-to: field in your header should contain a
valid Internet address, including full domain name. If your From:
field does not contain a valid Internet address, the answer will not
reach you. If this is the case, then use the reply command as shown

above. When needed, this command should always be the first command in your message.

IMPORTANT: Please use the quit command in your message. This will prevent processing errors from message signatures.

PLEASE NOTE!: This is an automated system not capable of handling written requests. Any questions on the info-server or the content of any of its files should be directed to mtracy@arrl.org.

ALSO NOTE!: Do *NOT* reply to messages sent from info@arrl.org - the reply address is redirected to keep bounced messages from endlessly looping. Write a new message to info@arrl.org instead.

The Technical Information Service gives League members on the internet better access to the knowledgeable technical staff here at ARRL HQ. Questions relating to Amateur Radio and related technical topics are welcome. To use this service, send a normal e-mail message to tis@arrl.org with your question spelled out in plain english. For best service, be as specific as possible and keep your line length in messages to a maximum of 80 characters. Due to personnel limitations, priority will be given to questions from League members.

Best Regards,

Michael Tracy, KC1SX, ARRL Technical Information Services Coordinator
(e-mail mtracy@arrl.org)

Sample of files available from INFO: (There are lots more!)

Note - If you are not yet an Amateur Radio operator retrieve the file prospect (send prospect) for information on how to easily get started in this fun hobby.

Part 15 of the FCC rules permits you to transmit up to 100 milliwatts
(0.1 Watt) without a license as long as you do not cause interference to
licensed stations. I believe there is a restriction on the size of the
antenna you can use.

AM transmitter kits are available from Ramsey Electronics and also from
Pan-Axis Productions in California: (916) 534-0417

1644. NEED bare-bones FM transmitter plans

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-04 22:00:19 UTC
From: gt0265d@prism.gatech.edu
Message-ID: <2va0pj$df2@acmey.gatech.edu>
Source record: 117383

Hello all!

I picked up one of those recordable greeting cards the other day... even got it free, since it was a Father's Day card they no longer could sell! Anyway, after playing with it (much fun) I decided that I could hook it up to a tiny FM transmitter and have a club event, using the card's circuit to record a little message like "This is KD4UGI and you can't find me, hahaha!" and have a transmitter hunt. Anyway, what I need is just a basic FM transmitter circuit, hopefully one that can be built in a short time with basic equipment (read, soldering iron and wire cutters) and (more importantly) and can be hooked up to the recording circuit. The chip sends its audio to a cheapo small speaker, so I'll need a way to interface this output with the transmitter.

Could a $10 Radio shack walkie-talkie (do they still make those things?) be easily converted to ~145 MHz, and could the power be increased slightly to provide roughly 1 or 2 watts (or a 3 mile range)?? How would I do this, and how much will it cost? Would I be better off starting from scratch?

Thanks for your help. If this is on some FTP site, that's cool too, just point it out to me.

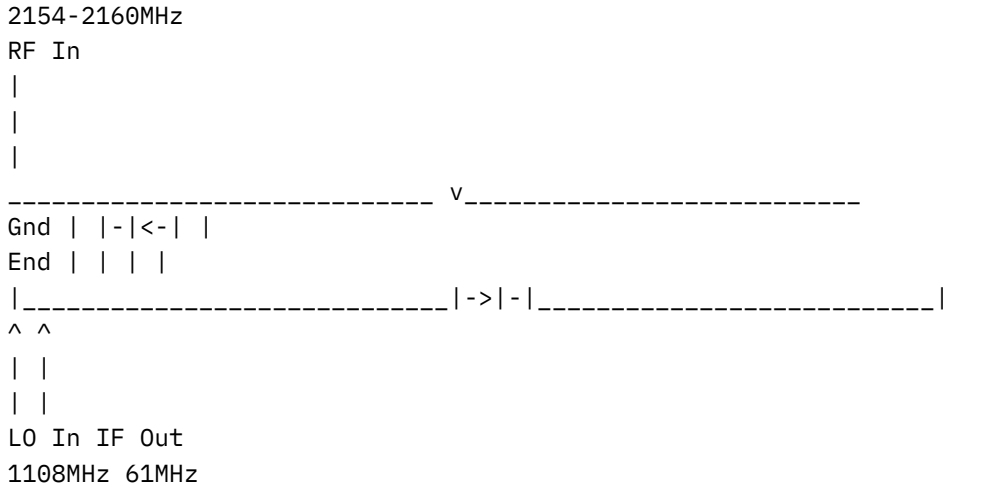
I'm looking for a reasonably priced copy of Radio Engineers Handbook by Terman, dated somewhere back in the WWII era. (Please note the exact title; there are 3 other books by the same author with the word "radio" in the title.) Forgive me if this is not the most appropriate place to post this request, but a) my Internet access is extremely limited and I can only read rec.radio and can only post to rec.radio.amateur (can't complain for only $5 a month) and b) I know for a fact there are a lot of sharp folks out there on this particular distro list and many of you have to have this book. (Being willing to part with it is an entirely different matter!) 73 de WA8MCQ

1647. microwave mixer details

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-05 12:56:07 UTC
From: David DiCarlo <r14793@waccvm.sps.mot.com>
Message-ID: <1994Jul5.125607.20581@newsgate.sps.mot.com>
Source record: 117386

I dug up an old 73 Magazine article from 1980 for an MDS microwave downconverter. It uses an oscillator with half the frequency of the desired local oscillator and a half-wave air-line microstrip mixer. It converts 2154 and 2160 down to channel 3 (or 2 or 4 depending on how it is tuned).

The microstrips are held above the ground plane 1/16 in, and the strips are
3/16 in wide. The grounded end is 2-3/4 (7cm) in long and the rf side is 2-5/8 in (6.77cm). The diodes are oriented as shown (HP 5082-2835), and there is half an inch between the 2 strips for the diodes. The IF out is tapped at the half way point of the ungrounded strip. I have not shown the
high and low pass filters, and have noted the original frequencies.



What I want to do with this is convert the whole thing to a block converter
for 2500 to 2700 MHz down to 200-400 MHz. The local oscillator would be 1150
MHz, easily in range of the local oscillator of this article. I want to build
this on a double sided FR4 board as well.

I have pretty well figured out the width of the strips to keep the impedance
the same as in the air case. But I don't know if the lenght of the half wave
strips should be tuned for the local oscillator or the incoming signal, and
whether or not the 1/2 inch between the strips is all that critical.

Does anyone know?

Thanks,
Dave DiCarlo

> not the 1/2 inch between the strips is all that critical.

One of the two should be tuned for the incoming signal's frequency, I would guess, as this would have the effect of making the incoming signal stronger through resonance. The other should be tuned to the incoming signal plus or minus (looks like plus from the length of the IF Out side, and jibes with good converter design principles) the IF frequency.

The half inch is probably just enough room to mount the mixer diodes, as microwave types tend to be really big-cased for some reason. When you get the diodes, measure them and set the spacing between the strips to be as close to the ends of the diodes as possible. Your biggest worry about losses is from inductance and conductance of solder at these frequencies. Pb/Sn solder is measurably less conductive at these frequencies than clean copper, but not so much that you'll really notice. Bad joints are more the issue.

I've worked at 915MHz for two years, and this isn't a lot different in the basics. Good luck on your project!

1652. ACS (Al's Circuit Simulator) version 0.14 is available

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-06 03:34:09 UTC
From: al@atd.rochester.ny.us
Message-ID: <1994Jul6.033409.14028@atd.rochester.ny.us>
Source record: 117395
Cross-posted to: sci.electronics.cad,sci.electronics,comp.lsi,comp.lsi.cad,rec.radio.amateur.homebrew

A new version of ACS (Al's Circuit Simulator) has been posted to alt.sources. It is also available by ftp from cs.rit.edu or ee.rochester.edu. (in pub/acs). If you don't have net access you can get it by dial-up from (USA) 716-272-1645.

ACS is a general purpose circuit simulator. It performs nonlinear dc and transient analyses, fourier analysis, and ac analysis linearized at an operating point. It is fully interactive and command driven. It can also be run in batch mode or as a server. The output is produced as it simulates. Spice compatible models for the MOSFET (level 1 and 2) and diode are included in this release.

This version (0.14) includes several improvements including convergence improvements, a new "alarm" command, and significant bug fixes in time step control. There are other minor improvements.

Since it is fully interactive, it is possible to make changes and re-simulate quickly. The interactive design makes it well suited to the typical iterative design process used it optimizing a circuit design. It is also well suited to undergraduate teaching where Spice in batch mode can be quite intimidating. This version, while still officially in beta test, should be stable enough for basic undergraduate teaching and courses in MOS design, but not for bipolar design.

In batch mode it is mostly Spice compatible, so it is often possible to use the same file for both ACS and Spice.

The analog simulation is based on traditional nodal analysis with iteration by Newton's method and LU decomposition. An event queue and incremental matrix update speed up the solution for large circuits.

It also has digital devices for mixed signal simulation. The digital devices may be implemented as either analog subcircuits or as true digital models. The simulator will automatically determine which to use. Networks of digital devices are simulated as digital, with no conversions to analog between gates. This results in digital circuits being simulated faster than on a typical analog simulator, even with behavioral models. The digital mode is experimental and needs work. There will be substantial improvements in future releases.

ACS also has a simple behavioral modeling language that allows simple behavioral descriptions of most components including capacitors and inductors. Unfortunately, it is not well documented.

ACS uses an object oriented approach to modeling. Complex models like MOSFETS are made of simpler ones like resistors, capacitors, diodes, and any other models that may already exist. The model designer does not need to worry about details like convergence checking, bypass checking, integration, or how the new device plugs into the solution matrix because these are already taken care of by the basic models. This results in a dramatic improvement in the time it takes a researcher or model designer to install a new model, compared to Spice.

The source and documentation can be obtained by anonymous ftp from ee.rochester.edu or cs.rit.edu in /pub/acs. It can also be obtained by dial-up (USA) 716-272-1645 in /pub/acs. It may be distributed under the terms of the GNU general public license. The dial-up also has some test circuits, pre-compiled executables for Next, Sun4, MSDOS and possibly others, and documentation in dvi and postscript.

If you are tired of Spice and want a second opinion, you want to play with the circuit and want a simulator that is interactive, or you want to study the source code and want something easier to follow than Spice, try ACS.

ACS is an ongoing research project. It is being released in a preliminary phase in hopes that it will be useful and that others will use it as a thrust or base for their research. I also hope for some comments that may help me direct my research.

I have a problem with RF feedback in my mic only when I touch
the mic to my face while speaking. It seems that it is making the
Radio Squeal. I have a RCI 2950 with a Texas Star DX 667V amplifier'
and a cheap Mag-mount base with a base loaded antenna with about
a 3.5" whip on top. I do not have this problem when not using
the amplifier. On AM it sqeuals when I talk. On SSB it is fine until
I start talking and then it Stays keyed up and squeals for a few seconds then
stops. I have had this problem with other Equipment too. But not this
bad.

If anyone knows of some RF filtering Technics for Microphones
I would appreciate it very much. I can't DX without the amp very
well because of the Low gain of the antenna. I am new at this so
if you get real technical with terms please remember to elaborate a
little. If anyone else has had this same problem with the 2950 or
any other radio I would be glad to hear how you got rid of the squeal
and the feedback.

thanx in adv.

Hi !
Some time ago, I posted here some request regarding the design of empty cavities to implement high-Q band-pass filters [for a repeater project].
I found some infos, but the dimensions of the required box seem to be at best unpractical [Even for an UHF repeater].
Some OM told me about 1/4-wave "cavities" which seem to be in fact special coaxial lines. Much smaller than true cavities, but with a wire running through the empty space.
Does anybody have any info regarding this type of filtering device ? I understand it also work by a resonnating process, maybe with a clever impedance transformation, but I have no further clue. Also, the OM I talked with admitted he had bought it from a commercial source, then had them fitted for the application.
I understand also that the Q of those filters is much lower than those of true cavities.

Thanks,
Vincent.

>a 3.5" whip on top.

Ok, You are probably getting rf everywhere! Do you mean a 3.5 foot antenna, or a 3.5 inch antenna? You say its a magnet mount, you DEFINATELY need a solid ground!!! I have had problems with cb & 2m magnet antennas getting sufficient ground. I have heard of others that tried magnets for hf mobile, with "hot" microphone results.

I am assuming that you are running inside a house since you are using an amp.

I am not experienced with hf transmitting, Im just a no code tech that hacked cb & swl for a few years and recently jumped in head first. I expect that a longer whip and solid electrical ground to waterpipes, heating radiators, I even expect that metal forced air heating ducts might make an improved rf ground indoors.

My 2 cents, hope its useful

Although this is a 'homebrew' newsgroup, I also wanted to
post this 'solution' (which I emailed the original poster).
A simple and relatively inexpensive route would be for
him to buy an FM Converter for his AM radio. I owned one for
several years, and it served me well. It only cost around $16,
and was easy to install. With it he can still use the CD adapter.
Now this might bring up questions of fidelity but remember
the end processor is an AM radio, with its possible narrow bandwidth.

Has anyone ever built a converter to change the AM wefax from NOAA satellites to FM wefax for reception with an HF fax demodulator? Is it possible? I'd like to be able to receive satellite photos direct from the satellites but don't want to spend another $XXX to buy a satellite wefax demodulator. I've found that by carefully tuning the signal from the satellite in SSB with a very narrow bandwidth I can copy the pictures a little bit but doppler shift makes this process very difficult. It would be much easier to receive the signal in FM from the satellite and convert the audio tone's amplitude modulations to frequency modulation and feed it to my HFFAX demodulator.
Alternately, is there software available to do the same thing with a simple interface?
Thanks,
John - VE8EV

ALL-A-N Carhart (acarhart@netcom.com) wrote:
:Where might I find a make-your-own-AM-transmitter kit?
:If it is low enough power, the FCC allows transmissions on the AM band, correct?
: Why not hook up a CD player (or tape player or even FM radio) to a transmitter
: with the power to only go a few feet...

I hesitate to even utter the name in an amateur radio group, but you will find relevant discussions in alt.radio.pirate. The thread "Transmitter Kit Sources FAQ" mentions a number of sources for cheap ($30) micro-power FM stereo and AM transmitter kits including Ramsey Electronics (Victor NY), DC Electronics (Scottsdale AZ), and Panaxis Productions (Paradise CA). I have no idea if they are any good. Also threads on what's allowed under FCC rules.

FM radio would be a better bet for listening to CD's in your car, with an audio bandwidth of ~15Khz vs the ~5Khz of AM radio (plus you get stereo). Might be worth replacing the AM radio with a junkyard AM/FM one (~$10?).

Trashing some other guy's reception as you roll by can be avoided by carefully choosing an unoccupied channel. On FM, you could verify the channel is still unoccupied every 50 miles or so by briefly turning off your transmitter. Perhaps the transmitter could take it's power from the CD's motor circuit, and thus automatically shut off after each CD? Propagation of AM signals is less predictable, and at night you may occasionally find your radio howling due to interference from stations a thousand miles away.

These interferance issues could be avoided entirely by pulling the coaxial plug at the radio that runs to the antenna, and inserting your own plug with coax running to the transmitter (could add some switching arrangement, and may need to attenuate the transmitted signal).

I've recently acquired several *THOUSAND* old vacuum tubes. I don't have time to post a list of all the type I have available, but I have a great deal of pre-1950 stuff which may be of interest to antique radio restorers. Tubes such as: Arcturus Blue (a cobalt blue envelope - one of the first triodes..), Audion, DeForest, Westinghouse, etc. I also have a great deal of Mil-Spec tubes with metal envelopes. IF anyone is interested in these components, please reply here.
I also have a complete set of Radio Repair manuals from 1926-1955. I have virtually all photofacts available at that time. I'm building a 100W tube amp for my bass guitar and would love to swap ideas with someone (is this the correct forum?).

Gary,
If you listen to WWV or WWVH on the hour or half hour they
give the address for information about all of their stations.
I don't remember it off the top of my head (I should since I
have heard it so much!) All you have to do is write to them
and ask for information about their stations. You will get more than
you will ever need! It is a really nice booklet (50 or so pages)
on all four of their stations (WWV WWVH WWVV WWVB.)

I think the address is:

National Institute of Standards and Technology Time
Radio Station WWV
8000 East County Road 58
Ft. Collins, CO 80524

1670. need schematic/source for KENWD IF-10B

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-07 15:51:15 UTC
From: sia@access3.digex.net
Message-ID: <2vh89j$6r2@access3.digex.net>
Source record: 117412
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Greetings,

I am looking for the schematic for Kenwood's IF-10B (not -C, -D,
or other), and have called Kenwood, their parts supplier, and virtually
all the relevant advertisers in QST without any luck. It is a tiny
board that fits in the "control board (??) / processor" compartment of
a TS-940 and is used for external (computer) control of the rig.

IF-10B is a discontinued accessory, and I'm thinking of kludging one
together.

If anyone knows a source, or is willing to mail me a xerox copy, please
drop me some email.

I will gladly reimburse your copying/handling/shipping costs...

Regards;

I have built a voice ID unit for use in a hidden transmitter.
I used the halmark card.
I had no trouble coupling the output from the card in my Kenwood TH78A
HT.

A 555 timer causes the unit to ID every 30 sec to 5 min (depending on
trim pot value), and also dekeys the HT to reset its timer.

The project works great.

Hello,

I recently purchased some radiosondes (devices which measure temperature, humidity, and pressure and are attatched to weather balloons) from an electronics warehouse. These instruments have a transmitter which operates at 403 MHz and transmitts a wide-band FM signal. The bandwidth is almost identical to that of a broadcast FM radio. What I am looking to build is a downconverter to bring the 403 MHz signal down to about 87 - 108 MHz. Are there any comercially available products which I could modify to do the job? Any ideas?? Thanks in advance.

Well, considering how hard it is to get a transistor, bipolar or FET, to run in a "linear" regime getting mixing action is no problem at all. In fact what you would do is remove *ANY* linearization tricks from the circuit such as an unbypassed emitter or source resistor.

To "predict" performance carefully either measure or estimate the curvature of the transfer function for largish signals. (The LO will clearly be a largish signal, nie?) Then take a Taylor series expansion on it. (Um, if you do not know what that is do a little extra credit reading.) This will give you a constant term plus a linear term plus terms for each "exponent" on the input voltage. FOr mixer action the interesting term is the squarelaw term. WIth that you can plug it into k*(a*sin(w1*t) + b*sin(w2*t))^2. Do your trig on this expression to extract the cos((w1+/-w2)*t) term (plus or minus depending on which mixer term interests you.) I recommend doing this at least once to get the "feel" for what is happening. (Actually I recommend specifically doing it for an LO signal which is large plus two smaller and equal level terms both on the same side of the LO and fairly close in frequency (radian frequency is w above.) This will give you an EXCELLENT idea of what IMD is all about if you fiddle with it a little.)

Once you have the appropriate expression for the terms of interest plug in some real values and see what you get. It should be fairly close if you get it right. (And I suggest FETs for the mixers. They have fairly close to square law input voltage to output current curves. Hence they tend to have better IMD (and hence crossmod) performance than bipolars.) And once you can get fairly close in predicting mixer performance you will be in a world few mortals ever seem to live. <^_-> (These days at least "mortals" can play with Spice and see results. But if they've never done the math they seldom have any idea WHY it works the way it does. Understand "why" and you can take the next step to

predictable control. THAT pays BIG bucks back when I was doing it. --- They just kept trying to ship my finger with the product.....)

1679. Tempo 2002 - HELP!

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-08 04:07:54 UTC
From: Dave Quick <quick007@maroon.tc.umn.edu>
Message-ID: <92479.quick007@maroon.tc.umn.edu>
Source record: 117218

Help!

I recently purchased a used Tempo (Henry) 2002 2 meter kilowatt amplifier.
(Uses a pair of 8874 tubes in push-pull)

The amp was custom built by Henry to operate on 194 MHz, and was used in an
MRI lab. I'd like to move the amp back down to 144 MHz.

I have the only technical manual available, which covers the 2002, 2006,
and 6N2. It has a schematic diagram of the amp, but does not provide the
dimensions of the tank coil, (a "U" shaped section of 7/8" tubing)
or any pictorial of the input circuitry.

Does anyone out there have a Tempo 2002, or have experience
servicing one?

Thanks;

Dave Quick WD0EKL

1682. Which VHF/UHF RSBG book is the one I want?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-08 14:19:48 UTC
From: os2user@vmdoug.utsd.att.com
Message-ID: <1994Jul8.141948.12201@devildog.att.com>
Source record: 117222

I heard that the Radio Society of Great Britain (RSGB) had published a good book on VHF/UHF. The book I was looking for has construction articles on building VHF and UHF downconverters, transmitters and receivers. Upon closer examination, however, I found that there are two books published by RSGB with "VHF/UHF" in the title. One is the "VHF/UHF DX Book" by Ian White and the other is "VHF UHF Manual RSGB" by G.R. Jessop. I can't figure out which one would have more articles on building and construction of VHF and UHF radio gear.

So which book is the one I want? Or do I want one of those Microwave handbooks?

How does one measure the large-signal transfer function at HF?
High-bandwidth X-Y scope?

> (And I suggest FETs for the mixers. They have fairly close to square
> law input voltage to output current curves. Hence they tend to have better
> IMD (and hence crossmod) performance than bipolars.)

So FETs are better because of the absence of higher-order terms? I'm not
sure I follow the logic here.

Are the spice transistor models good enough to predict intermodulation
distortion?

From: steve@hi.com
Message-ID: <steve-080794121655@brainiac.hi.com>
Source record: 117225

I've just purchased a CU-1388/FLR-9 receiver multicoupler from Fair Radio. Fair's catalog says it has "type-C" RF connectors. I can't seem to find a reference to type C connectors anywere, much less a place to procure some. They look like overgrown BNC's. Anyone know what they are, and where I can buy some? (Maybe they're MHV's?)

Also, anyone know where I can get a manual for this beast? Or at least information on how I adjust the Balance and Voltage Adjust trimmers on the front panel?

Finally, the case is stamped "Do Not Operate Without Airflow". It seems to have been designed to get forced-air cooling from ducts in the 19" equipment rack. I'll have to rig up some fans, but I'd like to know the design pressure and flow-rate for the original cooling system.

Thanks,
-Steve

1686. Re: Keyers and Positive/Negative keylines

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-08 16:27:39 UTC
From: yee@mipg.upenn.edu
Message-ID: <YEE.94Jul8122741@mipgsun.mipg.upenn.edu>
Source record: 117226
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.homebrew

Thanks to those who answered my queries regarding positive and negative key lines.

Now let me explain the reason why I asked. Any suggestions would be most appreciated.

I built the basic CMOS Super Keyer II awhile back. My intent is to eventually have a keyer that is as compatible as possible to any sort of radio equipment out there. The basic CMOS Super Keyer II uses a 2N2222 (?) for a positive key line.

I reasoned that there are several possibilities out there:
1) the to the rig could be either a phone or a phono jack.
2) the rig could be positive or negative key line
3) an external power supply may or may not be available.
4) ????

For possibility 1, I put in phono and phone jacks when I originally built the unit.

For possibility 2: When I originally built the unit, I installed a DPDT switch for the purpose of switching between the two types of key lines. I built the MOSFET level converters (both positive and negative) in an old QST article. The positive was built on the off chance there is a rig out there that has a positive key line but draws a lot of current. These were built over the last two nights and tested. I have not yet been put into the keyer since I need to purchase a 2P3T switch. I would prefer to use the DPDT switch as I have plenty of them but the both ends of a nine volt battery needs to be switched so that I have +9V and -9V depending upon which level converter is on line. Further, I figured out the I need to use a switch on the output of the two level converters. For some reason, the level converter not on line seems to short out the output of the other level converter if both outputs are wired together. While I hope to figure out how to avoid using a switch here, I am resigned to spending the money.

For possibility 3: I inserted an extra RCA jack to put in +12V when I built the unit. I would have preferred to use the ARRL standard MOLEX plug for this purpose but didn't want to use up the real estate on the case and I have plenty of RCA plugs lying around. My plan is to use a 1N400x (i.e. whichever I happen to have lying around) in case the polarity of the external power supply is screwed up. From the looks of it, the +9V is not critical so I will either use a 7810 or a crowbar IC to power the positive level converter. A 7805 will be used

to power the keyer itself. The -9V for the is a bit more difficult but according to Horowitz and Hill, I can use a MAX632 (?) to get -12V. Unfortunately, I have no experience in using a switching regulator. I am hoping that the voltage drop due to the 1N400x will not screw up the MAX632; I don't have the data sheet. Hopefully, the output of a few hundred mils will be all that I need. I suppose I'll need some sort of relay to switch between the internal and the external power but I haven't even begun to figure what parts I will use.

An unexpected problem is that I started this project with a rather SMALL box and am afraid that I will run out of real estate. As it is, the box already has three layers. The lowest is the keyer circuit itself. The highest is the AA battery holder glued to the top of the box. I am hoping that I can squeeze the level converters in the middle. The 9V battery is squeezed on the side of the box. I have no idea where I can put the power supply circuits.

I picked up three camcorder viewfinders at a surplus electronics store a
few years ago. They run off 12 volts, and are lightweight. I would
suggest you scan the electronic experimenter magazines for these type
places. The ones I got were only about $20 apiece, so you should be
able to find something at a reasonable price.

Enh - approximate by measuring at DC. It worked quite decently, although it helps in designing anything to have a rough knowledge of the parasitic caps involved.

FETs are indeed better because the higher-order terms, which are sadly ALWAYS with us, are very much smaller than they are in bipolars with their exponential characteristics. (TO reasonable first approx bipolars are exponential V to I devices while FETs are square law V to I. The IMD and such comes from other terms.)

Re spice models vis a vis IMD: I dunno - I built my own small signal circuit analysis proggy long ago and did large signal analysis almost purely from "first principles" and data sheets. With experience I got pretty good at it. (And developed a firm liking for a matched quad of Siliconix 2N5397's (or a matched pair of U310s if I remember part numbers from back then) in a double balanced active mixer with LO on the gates. I'd set 'em up for about zero dB power gain. I'd get decent NF, maybe 1dB more than a "noiseless" mixer, and VERY good IMD intercept points. RF amps were a push-pull grounded gate pair of matched 2N5397s. Combo gave a quite low NF and an 80dB IMD rejection relative to 1uV. (Note that this measure is what the military insisted on rather than the IMHO shoddy amateur practice of referencing to sensitivity

level.) - Oh - this 80dB also included the muck that came from the antenna amp plus its 32 way power splitter in the 2 transistor version of the mixer I used in a sonobouy project at 170ish MHz. It was quite repeatable.)

(BTW - I am dredging some of these numbers out of darker recesses of my mind rather than darker recesses of my file cabinet at home. I'm lazy. <^_-> The quad balanced puppy was CONSERVATIVELY 80dB relative to a uV at the input of a 10dB gain preamp.)

: I am looking for the following parts:

: Lamp GE1819
: transistor 2N5490
: Voltage Regulator (12v) 7812 (NC7812C or NC7812K)

The 7812 is sometimes available inside the assorted voltage regulator ICs package from your local Radio Snack store.

The GE 1819 lamp is a 28V, .04A, .34 candlepower (appx) lamp, in a miniature bayonet base. It's rated at 2500 hours avg life. If I remember right, Radio snack also had a similar lamp. I bought a package of two to use as the non-linear resistance element of a Wien Bridge oscillator. I put one in and it was intermittent. I took it out and put the other one in and it had the same problem. So I took them back and exchanged them for another pack. But they still were intermittent. Apparently the filament leads weren't crimped adequately. The lamps would light because the heat would make it weld, but it wasn't any good at low currents.

The transistor is a standard JEDEC number so it should be easy to find a replacement part number from ECG, etc.

| electronics warehouse. These instruments have a transmitter which
| operates at 403 MHz and transmitts a wide-band FM signal. The bandwidth
| is almost identical to that of a broadcast FM radio. What I am looking
| to build is a downconverter to bring the 403 MHz signal down to about
| 87 - 108 MHz. Are there any comercially available products which I could
| modify to do the job? Any ideas?? Thanks in advance.

The ARRL Handbook has a project to convert 440 to the 10m band and vice
versa -- the downconversion part is rather simple. It shouldn't be too
hard to modify it for what you need.

You might check into using dental adhesive. It is extremely
strong and has good heat conducting properties. It is NOT
flexible, however. So if you need shock-absorbing ability,
this stuff may not work.

1699. CB sets to 10 meters and 6 meters

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-09 15:06:13 UTC
From: wa2sff@arch4.ho.att.com
Message-ID: <CsoHyE.AxF@nntpa.cb.att.com>
Source record: 117239

I know that the FCC required CB manufacturers to fix the PLL chips so that out of band mods are "impossible." But given the success in mod'ing scanners and cellular phones, I assume some cb sets must be easy to mod.

I have seen postings before but no real info. Are there any good CB sets to buy and modify for the 28.0-29.7 band? My ultimate goal is to put one on six meters.

I know that the Uniden 2510 and 2600 are good choices they seem to have high prices at Hamfests. I assume the real market for those radios is the freebanders not hams.

Please no flames as I am asking this question as a ham (>30 years) and do not plan to work the freeband with the info. Anyone can check my address in the call book and call me at home. I have a listed number. Also notice the originating address (company and login id).

I would like to swap information with anyone with ideas to build or modify a rig for 6 meters. I have no interest in kits that don't work.

I think there are opportunities:

1) for designing a low cost kit that works for 6 meters,

2) writing a magazine article about the kit, and

3) Writing an article about modifing radios for 6 meters.

I have no hope that Uniden will have a 6 meter version of the 2600 since I don't think most 2600's are sold to hams.

Joe,

There were several good articles in 73, etc in the early 80's and late 70's for converting the so-called Hy-Gain boards. These were surplus PCB version partially assembled CB rigs that were apparently built up for the anticipated CB boom (you know, that trucker song, etc.) These mods are easy to make for 10 meters, I helped some people get some of those going. They work for 10M AM and FM, but not SSB. I also don't think that 6M was addressed.

a crystal mixed SSB radio. These were not PLL synthesized but just mixed crystals. Just some algebra and new crystals and your there to 10M anywa. I also did one of those and it worked well. But now I have a 2600 which works even better (more that 40 channels.)

As for 6M, I would try to roll one from scratch. Ramsey makes a 6M FM kit though.

Have Fun and 73,

Tom Xydis KC9DM tgxydis@aol.com

Message-ID: <CsqGDn.DFs@nntpa.cb.att.com>
Source record: 117242

I have 5 working Hygain boards and have most of the articles from the 70s and 80s on modifying them. I also have the 10 meter FM book my Heil. I have put some of the boards on ten meters.
I have found them touchy. Some move straight forwardly and others just don't seem to want to work when moved. I am looking for some more modern designs to play with.

I have a PH.D in EE and have extensive experience in designing/modifying my own equipment. I am also very familar with PLL design as I have worked with them over the years and have moved other PLL radios. If I have trouble putting some of the boards on ten meters how does someone with less knowledge do it?

I am aware of the RAMSEY kit but would like to find some one who has a working one. I still see postings of the order of "I built the RAMSEY kit but it only has 1 watt output instead of 5 how can I get it up to 5 watts? etc., etc., etc."

In spite of the problems, I am tempted to buy one for the ideas/parts to build something that works.

Any thoughts on modifications or new designs would be appreciated.

Joe Wilkes

Now TWICE as many outdoor Tailgate spaces are available...

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

FLEA all SUMMER at MIT
July 17th, 1994
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $2 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

!! RAIN or SHINE !! Have no fear of rain, a covered
tailgate area is available for all sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

1709. My List of Mail Order Electronics Companies

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-11 13:33:09 UTC
From: jfw@ksr.com
Message-ID: <2vrhml$d97@hopscotch.ksr.com>
Source record: 117251
Cross-posted to: sci.electronics,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.info

A long-delayed update, as usual :-).

[$Revision: 2.17 $; last updated July 11, 1994]
[Author: John Woods, WB7EEL, jfw@ksr.com, jfw@jfwhome.funhouse.com]

Here is my list of companies which will sell electronic components in small quantities. Many of these places I have bought from, several I haven't. Being a ham radio operator, I am most interested in RF components, and in particular, air variable capacitors, which tend to be scarce (and tend to be used or surplus even if I've otherwise labelled the seller as "NEW").

Categories are:
NEW COMPONENTS Distributors and sellers of new components, or "new and some used" in a couple of cases.
SURPLUS ELECTRONICS Usually overstocks, occasionally used equipment. Ideal for stocking the junkbox, usually have dependable stock lines of resistors, capacitors, and some semiconductors, but won't have those LCD modules forever... An invaluable resource, don't shy away from them.
SPECIALTY COMPONENTS In particular, crystals and toroidal cores.
KITS Ham radio kits, random electronic kits, whatever they have.
LITTLE GUYS Separated out because of some twisted sentimentality, I suppose. Intended to honor one or two ham spare-bedroom operations. Note that sending $1 along with catalog requests is a big help for these folks.
PUBLICATIONS A small selection of publications dealing with electronics, especially RF electronics.
QRP CLUB PUBLICATIONS Clubs for low-power amateur radio enthusiasts; frequently have publications with quite a bit of technical content (which is why I'm a member of QRP clubs headquartered thousands of miles from where I live :-). Note, this is generally practical technical content (how to build it) rather than theoretical technical content (why it works), but definitely more than Contester's Quarterly.

Note on shipping costs: I don't always update these frequently enough, and they're generally for continental US unless otherwise mentioned.

NEW COMPONENTS:

Digi-Key
701 Brooks Ave. South
P.O.Box 677
Thief River Falls, MN 56701-0677
+1-800-DIGI-KEY (334-4539)

+1-218-681-3380 (FAX)
No minimum, $5 handling under $25, free and very complete catalog, very nice indeed. Prices aren't always the best, but rarely excessive. Weak on RF specialty parts (though they now have the ever-popular NE602AN), but they do have blue LEDs.

Mouser Electronics Mouser Electronics Mouser Electronics
11433 Woodside Ave. 2401 Highway 287 North 12 Emery Ave.
Santee CA 92071 Mansfield TX 76063 Randolf NJ 07869
Mouser Electronics
370 Tomkins Court
Gilroy CA 95020
Catalog Subscriptions: (800) 992-9943 (Continental US only)
Sales & Service: (800) 34-MOUSER (800-346-6873) (US, Puerto R., Canada)
Very complete catalog of brand-new components (though no air variables). Usually quick service, $20 "minimum" ($5 charge under $20). When ordering, you may want to be sure to ask about availability and shipping locations; they have several warehouses, and frequently orders will get sent from several warehouses (which drives up the shipping costs). Export orders have a $100 minimum, except for Canada and Mexico.

Ocean State Electronics
P.O. Box 1458
Westerly RI 02891
+1-800-866-6626 (orders)
+1-401-596-3080
+1-401-596-3590 (FAX)
Minimum $5, S&H $4, free catalog. Wide array of RF parts, especially air variables and B&W coils.

Radiokit (store is located at:)
P.O.Box 973 169 Jeremy Hill Rd.
Pelham NH 03076 Pelham NH 03076
+1-603-635-2235
+1-603-635-2943 (FAX)
No minimum ($3 service charge if under $20), many kits, lots of J. W. Miller chokes & coils, B&W coils, RF switches, Millen variable capacitors, lots of parts in general. As of 24-Feb-94, they are again STILL out of catalogs, and just barely might have one by Dayton this year. They do accept mail orders, but you'll have to call for prices and availability. A classified ad in 3/94 QST says "Call/SASE", I guess they may have fliers.

Circuit Specialists Inc
P. O. Box 3047
Scottsdale AZ 85271-3047
+1-800-528-1417
No minimum with check or money order, $15 otherwise. $3 S&H.
New electronics, good RF assortment, increasing infestation of computers.

Active Electronics
11 Cummings Park 237 Hymus Blvd
Woburn MA 01801 Pointe Claire, Quebec, H9R 5C7

+1-800-677-8899 (Main number for US and Canada)
+1-514-630-7410 (International)
+1-514-697-8112 (FAX)
$25 minimum, $5 S&H UPS, catalog has a "$10 Suggested retail price" but they sent mine for free. They have 7(?) stores in the US (Chicago IL; Baltimore MD; Woburn MA; Detroit MI; Mt. Laurel NJ; Long Island NY; Seattle WA) and 10 stores in Canada (Quebec City; Montreal (2); Ottawa; Mississuaga; Winnipeg; Calgary; Toronto; Edmonton; Vancouver BC). Each store has its own 800 number and FAX number, call the main number(s). International orders are to be mailed to the Canadian address, but they want payment in US funds! Lots of stuff, oriented more toward supplying last-minute requirements of companies than hobbyists, but perfectly happy to take your money in small doses (stores have no minimum order). The $25 minimum for certain items is no longer explicit, but they note that some items will "ship in factory minimum package quantities", which might be worse.

Maplin Electronics Ltd.,
P.O. Box 3,
Rayleigh,
Essex,
SS6 8LR
U.K.
Phone numbers: your international code +44 702 554161 for sales
+44 702 553935 Fax
+44 702 556001 Tech enquiries(2-4pmGMT)
"Over here [in the United Kingdom] the main hobbyist electronics supplier is Maplin Electronics who stock a wide variety of equipment. They have a catalogue which can be shipped for 10.65 pounds sterling by air or 5.50 pounds sterling by surface mail. They accept Mastercard, American Express and International Reply Coupons. They have at least one type of air-filled variable capacitor!" (Thanks to Kev White at Cambridge University).

Newark Electronics
Send catalog requests to:
Newark Electronics
ATTENTION CATALOG DEPARTMENT
4801 N. Ravenswood Ave.
Chicago IL 60640-4496
+1-312-784-5100
They don't have a single mail address or phone; instead, one is supposed to call the closest of three pages worth of branch offices. I don't feel like typing in the entire list (it's copyrighted, anyway :-), so send email for your "local" distributor, or call their administrative offices at the number above. They have a $25 minimum order; they are a Real Distributor, but accept small orders (over the minimum, of course). Their catalog currently 1488 pages; they are very complete (except, of course, for my favorite scarce item, the air-variable capacitor). Note that the catalog prices tend not to match reality all that often, so order by phone rather than by mail; prices tend to be higher than other places, but they have a lot of things that are hard to find from other outlets. Also note that they have six Canadian offices, and one UK office, and will take international orders

at 500 N. Pulaski St., Chicago IL 60624-1019, +1-312-784-5100
(FAX +1-312-638-7652, TLX 6718690 NEWARK U).

Arrow Electronics, Inc. Catalog requests to:
Catalog Division Catalog Division
1860 Smithtown Ave. 25 Hub Drive
Ronkonkoma NY 11779 Melville NY 11747-9828
+1-800-93-ARROW
Minimum $25; they no longer have a catalog. They are a Real Distributor, but also didn't mind my placing a personal order (a couple of years ago).

MCM Electronics
650 Congress Park Drive
Centerville OH 45459-4072
+1-800-543-4330
+1-800-824-TECH (product questions)
+1-513-434-6959 (FAX)
Minimum $20 ($25 for charge cards, and they don't take personal checks), handling $1.95 + shipping. Oriented toward repair technicians, really heavy on VCR parts and somewhat overpriced doodads, lots of useful stuff not easily found elsewhere.

Fordham Radio Supply
260 Motor Parkway
Hauppauge NY 11788-5134
+1-800-695-4848
Tools for technicians. One or two items are not outrageously overpriced.

Jameco
1355 Shoreway Road
Belmost CA 94002
+1-800-831-4242
+1-800-237-6948 (FAX)
+1-415-592-8097
No longer have a minimum order, reasonable selection of parts again (in addition to computer components).

JDR Microdevices Just moved!
1850 South 10th Street
San Jose CA 95122-4108
Orders: +1-800-538-5000
+1-408-494-1400
FAX: +1-800-538-5005
+1-408-494-1420
Cust. Service: +1-800-538-5001
Tech Support: +1-800-538-5002
BBS: +1-408-494-1430
No minimum, $5+ shipping. Mostly computers now, but they haven't yet decided to abandon components; indeed, they recently dropped their minimum order requirement entirely.

Johnson Shop Products
P.O.Box 160113
Cupertino CA 95016
+1-408-257-8614
+1-408-253-6288 (FAX)
Catalog $1. No minimum. Shipping charge is based on UPS; very small orders that can be sensibly shipped in a first-class letter, include money for first-class postage. New and some used electronic parts.

DC Electronics
P. O. Box 3203
Scottsdale AZ 85271-3203
+1-800-423-0070 (orders)
+1-602-945-7736 (stock/price checks)
+1-602-994-1707 (FAX)
$15 minimum charge order, no minimum for checks, $3 min. shipping&handling. Wide array of ICs, good assortment of electronic components.

EasyTech Inc *** out of business? ***
2917 Bayview Drive
Fremont CA 94538-9932
11 May 93: "EasyTech no longer has an 800 number, and has dropped several lines. The last time I called them (2 months ago), I got the impression they were slowly going down the tubes..." - dts@banyan.com "Both of their 800 number and the customer services numbers are disconnected, and no new numbers are given." - lau@gandalf.rutgers.edu

International Components Corporation
1803 NW Lincoln Way
Toledo OR 97391-1014
+1-800-325-0101 (US & Canada)
+1-503-336-4400 (FAX)
Cabinets&Enclosures; Capacitors; Diodes; ICs; Potentiometers; Resistors; Sockets; Transistors; Books. No minimum order, $2 handling under $25.

Kelvin Electronics
7 Fairchild Ave.
Plainview NY 11803
+1-800-645-9212
+1-516-349-7620
+1-516-349-7830 (FAX)
Minimum order $20; S&H 5% of order ($5 minimum, extra for large stuff, overnight, export (like to Hawaii :-), and etchant; based on UPS charges). Lots of electronic parts & tools, some robotics supplies, model rockets.

H & R Company (Herbach and Rademan)
18 Canal Street, P.O.Box 122
Bristol PA 19007-0122
+1-800-848-8001 (Orders)
+1-215-788-5583
+1-215-788-9577 (FAX)
Minimum order $25 ($5 processing charge under $25), shipping $4.75 under $30; Most items are new overstocks, much regularly stocked stuff as well. Tools,

electrical supplies, motors, mechanical components, robotic components.

John Birkitt
1, The Strait, Lincoln
+44 522 520767
Lots of stuff for the practical enthusiast. Many bargains to be had if you've the patience to sort through the extensive heaps of assorted electronic miscellany. Good stocks of new components, tools and books, masses of RF gear and very competetive prices.
Two shops side by side cater for the "consumer" type goods and the "electronics" type. Does mail order, takes visa/access etc. Mail order list contains lots of unusual goodies that you'll possibly never see on offer anywhere else. (thanks to Dave Walster @ lincoln.gpsemi.com)

N R Bardwell
Abbeydale Road, Sheffield
+44 742 552886
Possibly the busiest electronics emporium I've ever visited. Specialises in radio gear and alarm equipment but many of the obligatory bags of "unmarked, untested" goodies makes Bardwell's *the* place to go. Friendly, efficient and knowledgeable staff. Cheap. Very cheap. Thriving mail order business with some good bargains in IC's and discrete's. Write/phone for a price list. (thanks to Dave Walster @ lincoln.gpsemi.com)

SURPLUS ELECTRONICS:

All Electronics Corp.
P. O. Box 567

fax: +1-216-621-8628
$10 minimum. Surplus electronics.
"Also known to stock many components, but this is not discussed in the catalog. Local store, a cleveland institution, is called Electronic Surplus, Inc., and has been there since '48. Third generation now runs it." -- wb8foz

Surplus Sales of Nebraska
1502 Jones Street
Omaha, Nebraska 68102
+1-402-346-4750
+1-402-346-2939 (FAX)

New and surplus radio electronics. Wide selection: air variables.
Catalog $3 (free with order, refundable with $25 catalog purchase).

Tucker Surplus Store
1717 Reserve St.
Garland TX 75042
+1-800-527-4642 extension 135
Surplus electronic gear; oscilloscopes and signal generators from the days when dinosaurs with vacuum tubes roamed the earth (some solid state gear, but all well used). Prices seem relatively high, and you'll be shocked to learn how much it costs to ship a 75 pound oscilloscope by motor freight...
[Steve Brown, N8HFI:
In defense of Tucker, the have a broad selection, repair facilities, and they certify the used equipment to meet the original specification and warranty it for 90 days. Not every source does this:]

Davilyn Corp.
13406 Saticoy St.
North Hollywood, CA 91605-3475
+1-800-235-6222 (Ex. CA)
+1-818-787-3334 (CA)
+1-818-787-4732 (FAX)
Surplus electronic gear.
[has much better prices [than Tucker], but sells used equipment as-is. -N8HFI]

SPECIALTY COMPONENTS:

JAN Crystals
2341 Crystal Drive
P.O. Box 06017
Fort Myers FL 33906-6017
+1-800-JAN-XTAL (Monday through Thursday)
+1-813-936-3750 (FAX)
+1-813-936-2397 (plant)
They make crystals. Minimum order is $10, which might be one crystal, or might be two.

Crystek Corporation
2351/2371 Crystal Drive
P.O. Box 06135
Fort Myers FL 33906-6135
+1-800-237-3061 (M-F) (US and Canada but not Alaska and Hawaii)
+1-813-936-2109
+1-813-939-4226 (FAX)
They make crystals too. They were the cheapest last time I ordered, but I don't have an up-to-date price list. It took about 4 weeks, and they had said it would take 6.

ICM (International Crystal Manufacturing Co., Inc.)
701 W. Sheridan
PO Box 26330
Oklahoma City OK 73126-0330

+1-800-426-9825
More crystals. They were more expensive, but they have lots of pre-made crystals for various rigs, so they would probably be faster.

Amidon Associates
2216 East Gladwick Street
Dominiguez Hills, CA 90220
+1-213-763-5770
+1-213-763-2250 (FAX)
Toroid cores and related things. Very fast service. Now takes MC/Visa and phone orders.

Palomar Engineers
Box 455
Escondido CA 92033
+1-619-747-3343
Toroid cores and shielding beads.

RF PARTS
435 South Pacific Street
San Marcos CA 92069
+1-800-RF-PARTS (Orders only)
+1-619-744-0700 (main order line & delivery info)
+1-619-744-0750 (customer service, warranty, tech & applications, 10AM-4PM)
+1-619-744-1943 (FAX)
Tubes and transistors. $2 handling below $20 for US orders; $5.50 minimum handling for Canada orders; they take foreign orders (but no handling info was given in the QST ad).

K2AW's Silicon Alley
175 Friends Lane
Westbury NY 11590
+1-516-334-7024
Free catalog, $10 minimum order. Semiconductors, in particular high-voltage diodes.

Small Parts, Inc. [New address and phone, 23 Dec 91]

+1-219-594-5580 (FAX)
C. M. Howes Communications kits. Radio mounts. RSGB and ARRL publications. $1 for catalog. $4 shipping & handling.

{See also RadioKit, Oak Hills Research}

LITTLE GUYS:

Oak Hills Research
20879 Madison St.
Big Rapids, MI 49307
+1-800-842-3748
+1-616-796-0920
+1-616-796-6633 (FAX)
Send $1 for a flyer. Some parts, QST article kits, transceiver kits, QRP stuff in general (they inherited the stock from Small Parts Center when they closed).

Dan's Small Parts And Kits (Formerly KA7QJY Components)
1935 S. 3rd W. #1
Missoula MT 59801
+1-406-543-2872
Send a business-size SASE (2 stamps) for a current list of parts. RF parts, including vernier drives and air variables; now also offers kits. $3.75 shipping, no minimum. Fast service, lots of satisfied customers.

Kanga US
Bill Kelsey
3521 Spring Lake Dr.
Findlay, OH 45840
+1-419-423-5643
call between 7 - 11 pm eastern time please. stamp for a catalog.

"I import kits from Kanga in the UK - most of them come from
SPRAT - the journal of the G-QRP Club. I also have the Super Tee Antenna
Tuner, and a range of kits from Elktronics that are based on the DDS
articles in 73 Magazine."

R&R Associates
3106 Glendon Avenue
Los Angeles, CA 90034
+1-213-474-1315 (res)
[Richard Rathburn, KB6NQ] "I mainly sell pc boards from QST, Radio
Electronics, etc., and a few of in-house design. I also sell IC's, etc."
Send a SASE every now and then for his most recent flyer. He also has boards
for some Motorola Application Notes. (Jan 94 -- a member of the QRP mailing
list reports some dissatisfaction with R&R.)

CW Technology
7328 Timbercreek Court
Reynoldsburg, OH 43068-1181
COD Orders at 800-547-7479
"I have a small (just me) mail order company through which I sell kits.
My starter products were kits for computer<->transceiver interfaces to go
along with my 2/93 QST article. Since, I have added a programmer kit for
the MC68HC705K1 microcontroller and an optoisolated stepper motor controller
kit. I also sell the PCBs and difficult parts for these projects."
- Wally Blackburn AA8DX

GNP Sales
POB 77011
San Francisco, CA 94107.
"Business size SASE for our current list.
We are very small, all three of us have "real" jobs. We buy and sell
vacuum caps, vacuum relays, various high voltage parts, coax relays,
mostly radio stuff." - Peter Gerba, pgerba@crl.com

Howard W. Sams & Company
P.O. Box 7092
Indianapolis, IN 26207-7092
+1-800-428-SAMS
Publishers of SAMS PHOTOFACTS and many other electronics books. There is an Annual Index of SAMS PHOTOFACTS whose cost I have forgotten. In-print Photofacts run between $14.95 to $39.95 (for computer Photofacts); they will photocopy out-of-print Photofacts for $11.95 + $2.50S&H for one page, plus $.55 per page thereafter.

RF Design Magazine
P O Box 1077
Skokie IL 60076-9931
+1-312-762-2193
A magazine for professional RF designers. Subscriptions are $38 per year in the US, $48 in Mexico and Canada, $51 elsewhere, unless you appear to be a "qualified subscriber" (i.e. are in serious danger of convincing your company to buy a $12,000 spectum analyzer based on an ad) in which case it's free. Heavy on theory, and even the advertisement articles are educational.

Electronics Now (formerly Radio Electronics)
Subscription Service
P.O. Box 51866
Boulder CO 80321-1866
+1-800-999-7139
A magazine for thumb-fingered electronics hobbyists. Subscription rate on the bingo card in the November issue (the latest I was able to dig up) was $19.97 per year.

Popular Electronics
Subscription Department
P.O.Box 338
Mt. Morris, IL 61054-9935
+1-800-827-0383
Like Electronics Now. $18.95 according to the latest bingo card I see.

The Computer Applications Journal (Circuit Cellar INK)
P. O. Box 3050
Southeastern, PA 19398-9932
+1-203-872-2204 (FAX)
This magazine is what Steve Ciarcia wanted BYTE to be when it grew up. It focuses on microcontroller applications and other digital projects. $21.95 per year (12 issues, now) (Canada, Mexico: add $10 surface mail, $20 air mail; other countries: add $28.)

The Radio Craftsman
P.O. Box 3682
Lawrence, KS 66046-0682
Bi-monthly newsletter for homebrewers of amateur radio gear. Information about electronics construction techniques, components, book reviews, beginning electronics theory, and the occasional construction project. Oriented toward the beginner/intermediate level. Price, $10/year (six issues), $15 outside the U.S. Published by Doug Heacock, AA0MS. Send large SASE for free sample issue. [Info supplied by Doug Heacock.]

Date Founded: 1993
Number of Members: 200
Cost to Join: $5
Annual Dues: $5
Publication Name and Frequency: QRPp - quarterly
Net(s): None
Mailing Address:
Jim Cates, WA6GER
3241 Eastwood Road
Sacramento, CA 95821
This is the club that was selling the incredibly popular "NorCal 40" kit to members, and currently is about to sell the almost-certain-to-be popular Sierra kit.

North Texas QRP Club
(Subscription to)
Twilight Publishing Company
1301 West Highway 407, Suite 353
Lewisville TX 75067
Publication is the K5FO Newsletter (possibly changing name eventually). Filling in the gaps left by the publication schedules of QRPp and QRP Quarterly, Chuck Adams (K5FO) will be publishing a newsletter for low-power amateur radio enthusiasts in Feb, May, August, and November (thus ensuring that QRP enthusiasts must break away from their bench and visit the mailbox at least every 30 days, guaranteed :-). This also gets you membership in the North Texas QRP Club.
"In order to get your copies of the newsletter and to get your number, do the following:
1. Send letter with your name, call(if any), address, email address if you are on the super highway of information, and any other info you want in a membership book to
Twilight Publishing Company
1301 West Highway 407, Suite 353

Lewisville, TX 75067
2. Enclose on photograph of A. Lincoln ($5 bill) produced by the US Govt.
and a postcard with your name and address to acknowledge
receipt of same. I tend to hold on to checks too long. MO is
you don't trust the USPS. :-)"
May '94 will be the first issue, and there won't be any reprints, so get
in on the ground floor! (I will! -jfw)

NOTES:

This file, and many others, are available for anonymous ftp from
ftp.cs.buffalo.edu, in /pub/ham-radio (this article is "mail_order"
in that directory).

CHANGES FOR $Revision: 2.17 $

Add Kanga US, Kanga UK, RF Parts, Cirkit, Birkitt, Bardwell.
BCD Electro out of the mail order business.
Add CW Technology, GNP Sales.
Fix FTP listings (toxicwaste.mit.edu is no longer archiving sci.electronics,
give actual directory name for ftp.cs.buffalo.edu).
Add my name, since this seems to get shared around a lot.
Add QRP clubs as separate category.
Jameco is no longer apparently headed out of the components business, stop
complaining about them (for now :-).
Santa Clara Active Electronics is closed?
JDR moved, changed phone numbers.

>buy some? (Maybe they're MHV's?)

Type C connectors are indeed overgrown BNCs or more like Ns with the BNC
locking feature.

They are not real common but several places have them;

Pasternack Enterprises
Coaxial Products division
POBox 16759
Irvine Ca 92713
714-261-1920

Also try several of the coax connector vendors in CQ or QST.

I have used them for several years for patch panels at the plus kilowatt level
and they work good for this type of application.

You can't get the VHF/UHF DX book in the US at the moment. The ARRL has
been back ordered for months and non of the other suppliers have it.
I thought it was very good and was trying to get another copy for a friend.
Does anyone know a source in the US for this book (or how much is
it via the RSGB and how do I get it from the US?)

I am preparing to align an older hf rig, Tempo One,
and wonder if there are any good tips on aligning the rx & tx circuits.

I have a pseudo RF generator, "a modified dip meter oscillator" in an old
heathkit RF generator box. Its not accurate freq wise, I dont want to
screw up and Peak the IF off center. I thought of just using the antenna input
and peaking from the bottom up.

Comments?
Tips?
Ideas?
Things not to do?

Source record: 117254
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.antenna

At the Dayton Hamfest there was a fellow selling RDF kits
based on the May 93 article in QST on the "Handi-Finder."

I bought a kit and it works fine.

I then followed up with an order for 25 kits for our
local ham radio club and RACES group.

Well 6 weeks later and one followup note later, still no kits.

The name of the fellow is "Stephan A. Douglas"

His mailing address is a PO box (same as on the order sheet)
and he has an unlisted number.

Has any one ordered any kits from him and received them?

The only money we are out is the cost of a money order
since the kits are to come COD, but if I knew he
wasn't going to deliver I would do something different.

My next step is to complain to the Post office.

I am also trying to buy the PC boards and make my own
kits for the club.

FAR Circuits sells boards and I have had good luck with them
in the past.

Message-ID: <steve-110794122128@brainiac.hi.com>
Source record: 117252
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Here's what I've heard so far regarding the denoising algorithms in the popular digital audio filters. None of this is confirmed, so take it with a grain of salt.

The Timewave unit uses the LMS/short-time correlation algorithm, but with a 16-bit converter.

The JPS NIR-10 uses an FFT/threshold/inverse-FFT algorithm, where FFT frequency bins that are below a threshold are set to zero. Some say that this produces more audible artifacts than the LMS/short-time correlation algorithm. I can't say for sure; I've only heard the NIR-10 and no others, but it seems like a reasonable claim.

The JPS units that advertise "pink noise reduction" appear to use the LMS/short-time correlation algorithm, like W9GR's.

1723. Air system sockets better?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-11 18:57:07 UTC
From: Waltk@pica.army.mil
Message-ID: <9407111457.aa16136@COR5.PICA.ARMY.MIL>
Source record: 117263

Anyone out there have any experience with air system sockets for the
3-500 or 4-400 line of tubes?

I am considering replacing the ceramic sockets in my homebrew amp,
with air system type sockets. The reason being that I find the noise
generated by the air passing thru the pressurized chassis, thru those
tiny holes in the cermic sockets, and out thru the tube base to be
too loud. I've mounted a squirrel cage blower in the adjoing room
and pipe the air in via large 4" hose. The blower is rated at
95 cfm @ 0" / 70 cfm @ 2" H2O. I have a variac on the blower and have
two settings, one for casual use and another for full-tilt contesting.
But, even at the lower voltage setting I find the noise objectionable.
I think the air system type of socket would present less resistance to
the air yielding lower back pressure. Hence, I could move more air with
less pressure. BUT, I don't know this for certain, and was hoping someone
reading this forum could give me another oppinion before I perform surgery
on the amp.

Thanx & 73 de Walt - K2WK waltk@pica.army.mil

I dunno about Microwave Harmonica, but it seems to me that a good part of Rohde's articles deal with calculating the system 3rd-order intercept given the 3rd-order intercept of the pieces. This is well and good, but it leaves me wondering how to predict the 3rd-order intercept of the pieces. I suppose one measures it in the lab. (Lab? What's that? :-) Since I'm lab-equipment-poor, I'm interested in good models that predict 3rd-order intercept reasonably well.

From: tallath@hookup.net
Message-ID: <tallath.3.0017A12F@hookup.net>
Source record: 117169

I was wondering if any of you fine gentleman could answer a simple question for me. I'm searching for what has been coined as a 'piston trimmer' capacitor. From what I know it is a variable capacitor but when I ask for it at Wackid's, Radio Shack, and electronics stores they either don't know what I'm asking for or have a vague idea what I'm talking about but can't seem to convey a good description of it to me.

This problem is compounded by the fact that I don't know what it looks like and don't know where I should look for one. I've checked the FAQ with no success. Could someone explain what it is, what it would probably look like, and since no one here - where I am, not in this newsgroup - knows what I'm asking for, could someone give an order number or suggest a good place to mail-order from that might have some.

Thanks

I still agree. Radiokit needs to get their act together. The QRP-20 kit has taken its rightful place in my ham career: as my first failure. Every solder joint checked, schematic traced, coils verified and turns recounted, etc. etc. They should *at least* tell you that the kit is for advanced builders or EEs :)
It was also missing 7 parts though they did mail the parts promptly.The manual is a joke, and would be just as worthless to the builder of the QRP-15, which is the manual supplied with the QRP-20.
C'est la vie. We learn.

If you can get one point on the IMD curve you can calculate the intercept point. So if your modeling SW provides "two interfering signals of -27dBm each produce an IMD product of -107dBm" or even "100dB dynamic range relative to sensitivity of -117dBm" etc you can work backwards to the intercept point.

Taking the first cited data, -107dBm birdy for two -27dBm signals, we can work backwards. For every 1dB we increase the signal levels the birdy goes up three or the difference drops by 2db. Since the difference is 80dB as cited we have to reduce the difference by 80dB to get signal equal to spur, in the method used with military projects when I was doing them. Hence we must change the individual signals by half the 80dB. -27dBm + 40dB gives an intercept point of +13dBm. (Which ain't all that bad.)

> Thanks

The piston capacitor is pretty much self descriptive. The capacitor is formed by a sliding piston insulated from an enclosed cylinder. The piston moves in or out of the cylinder depending on the amount of capacitance desired or required for tuning the circuit.

They do come in lots of values and sizes. Murata-Erie, Johanson, E.F. Johnson, and others make the parts.. The parts can be purchased from many of the vendors of RF parts (diffinently not Radio Shack) who are listed in all the Ham magizines as well as Radio-Electronics and others.

Good Luck with your project

Ron, K0RL

It's round, made out of glass or ceramic, and the capacity is between the
metal on the outside of the round tubular glass and the round tubular metal
cylinder that moves to and fro inside the glass tube. The glass or ceramic
is the dielectric. The end of the glass tube has a cap made out of metal
with a threaded hole in it, and the movable cylinder has a threaded rod
attached to it. Turning the threaded rod gives a precise movement of the
cylinder within the tube. Try Digi-Key 1-800-344-4539 (only one kind offered)
or Newark (many branches around the country but $25 minimum) 1-312-784-5100

-Correct

> ... This problem is compounded by the fact that I don't know what it looks
> like and don't know where I should look for one. ...

A piston trimmer capacitor physically looks like an insulative tube with an electrode on the outside (plated or foil wrapped) and an adjustable element that looks like a slug that slides in and out of the tube. The amount of capacitance, as you might guess, varies relative to the amount of the two conductive parts that are adjacent to one another (overlap?). Works just like any other variable cap, but normally uses the tube as dielectric instead of air (standard rotary variable) or air and mylar insulator (compression trimmer)

They used to be available from Allied, etc (years ago), and at all the surplus places. I haven't seen one in years, but that doesn't mean theyre not still available, just that I've not been looking for any. Typical size of the ones I've played with was around 1/4" in diameter and 1" long or less. I'd imagine you could use any trimmer _with_sufficient_voltage_rating_ and capacitance as a substitute.

Source record: 117177

Why do you specifically want a piston style trimmer capacitor?

What value do you want?

What do you intend to do with it?

I know of very low value tiny ones for UHF/low microwave use, and
giant jobs in the RF decks of old AR88's. If you want one to fit in
some existing equipment, or published design, you have to sort out
electrical value range and mechanical dimensions.

Cheers

If you'd like to spend a bunch of cash on a recent non-linear simulator, MDS
has been working well for me. Microwave Harmonica will also work. The problem with
simulating IP3 is that you ned models that represent the reality of the device
fairly closely. What I have been doing is to do modeling and banchwork in parallel,
so that I can confirm both sets of results independently.
As far as measuring IP3, all you need is 2 signal generators and a spectrum analyzer.
(Motorola paid for mine !) . A lot depends on the frequency band you are working in.

They're like a little white tube with a lead off each end and a screw going
into one end. Some are maybe 3/4" long by 1/8" diameter. Also called
multiturn trimmers. If you have the July-Aug 1994 DigiKey catalog, look
at the bottom of page 205 for pictures.

more stuff killed...

Most of the inexpensive (read *cheap*) piston trimmers are manufactured as
the above paraghaph describes. The -good- piston trimmers are usually made
of hi Q ceramic or Sapphire dielectric and the plates are usually concentric
circlular that mesh as you turn the adjustment control (usually a standard
flat slot). These caps are available in ranges from as little as 0.5pF to
about 40pF or so. These caps are used in microwave circuits and are also
found in circuits that require stable temperature/mechanical characteristics
you would need in a VCO or filter. There are several manufacturers that
have these caps as stock items; Johanson (probably the most popular), Voltronicsis another
and Sprague-Goodman are just a few off the top of my head. I know
there are at least a few more manufacturers that offer these caps as stock
itmes. Prices range from as low as $5 to as high as $25.

1748. Avatar Magnetics belly up?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-13 10:22:37 UTC
From: harrisok@admvax.sonoma.edu
Message-ID: <1994Jul13.022237.1@admvax.sonoma.edu>
Source record: 117185

I was just going through an old ARRL Handbook ('86) and came upon an interesting article about a 30 amp 13.8v power supply that I though I might try to build. I thought I would see if the listed manufacturers still made the parts.

The power transformer is a 117v. primary / 25.4vct secondary @ 34 amps (AV-399 by Avatar Magnetics in Indianapolis, IN) I decided this would be a good place to start and attempted to locate their phone number through directory assitance. No luck. I guess Avatar Magnetics has gone belly up?

Back to the drawing board I guess--

1749. How to design a button cell holder : suggestions

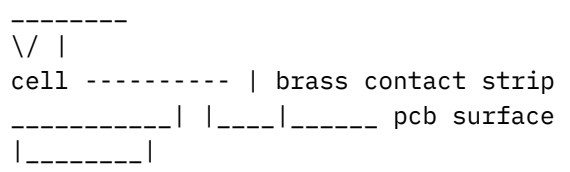
Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-13 13:20:23 UTC
From: jon_sree@world.std.com
Message-ID: <JON_SREE.94Jul13082023@world.std.com>
Source record: 117186

(Originally in sci.electronics; now posting to rec.* groups. Thanks)

My latest pcb takes 3 button cells (0.45" dia and about 0.2" high).
I'm looking for hints on how to make connections to the cells.

I have a serious height restriction, so the cells have to be placed
side-by-side, in a triangular pattern, not stacked up in the
conventional way.

I have three 0.45" dia holes in the pcb, and each cell will be held
in place by friction. Now the problem is how to make contact. Ideally,
I'm looking for a thin brass strip which can be bent to make a springy
contact with the cell.



similar brass contact on other side also

Where can I find such a brass strip ? This method of contacting is the
same as used on commercial cell holders, I think. Of course, they make
them in millions qty. Where can I find brass contact strips like
this in modest (100s) qty ? Or is there a place I can get a roll
of brass strip, and my assy shop can bend them the right way.

Any hints most welcome.

Thanks,

/ Jon Sreekanth

No, you want to connect the ungrounded end of the circuit to the
posts and ground the lug. This is so the movable plates, and hence
their bearing and shaft are at ground.

I need to convert a 10 - 13 volt source (ie. marine battery in
various stages of discharge) to a constant 15v at abt 1.5 amps.
It needs to be small and low-cost. I was thinking of using a
switched-mode-regulator in boost configuration, but can't find
any literature on sizing the inductor. Does anyone have any info
about this?
Also, there are a bunch of SMPS IC's out there. Anyone with
experience using them care to suggest which ones would be
useful for this application, and be readily available?

Thanks,

Jon,

I would check out a local hobby shop for thin brass stock. There are several shops in the Toledo OH area that carry a variety of different brass pieces for use in model railroad, airplanes, ect.

Conway-

Back in the 70's, an article was published in QST, describing the "WB4VVF Accukeyer". Follow-up articles provided memory capability. The keyer was quite popular, and eventually appeared in the ARRL Handbook.

Rigs in common usage then, were primarily the grid-block keying variety, with a relatively high, negative voltage on the key line. The Accukeyer output uses a 2N2222 (NPN) driving a high voltage 2N4888 (PNP) transistor, which keys the negative voltage to ground.

When I wanted to update my Accukeyer for a new solid-state TS-120S, I removed the 2N4888 from its socket, and moved the key line to the 2N2222 collector. Now, after many years in that configuration, I find that this modification was really not necessary! With a positive keying voltage, the PNP collector-to-base junction is forward biased, connecting the key line to the 2N2222 collector. Unless a rig requires too high a keying current, has too high a positive voltage for the 2N4888 base-emitter junction or can't stand 0.7 volts diode offset, the Accukeyer output circuit should work quite well with either polarity.

Other transistors that are possible substitutes for a 2N4888 in the Accukeyer configuration, include:

2N398A (Used in Heath HD-10 Keyer)
2N398B
2N1234
2N2042, 2N2042A
2N2043, 2N2043A
2N3495
2N3497
2N4889
2N5400
2N5401
HEP-239 (Now obsolete, Motorola replacement transistor)

With all this discussion about environmentally-friendly chemicals, I have to relate my conversation with MCM regarding an order of mine. The implications are scary for home-based techs such as ourselves.

I made a regular order with MCM several weeks ago that included a can of compressed air for a friend of mine ("Generation 2000 Air Blast", #20-1620). I inquired about my order and learned from the salesclerk that it had been shipped today (7/13) , but that there was a footnote to the effect that the chemical could not be sold to me. I *had* been expecting the UPS truck to show up this week (and waited at home too. Wonderful.) , but that wasn't the worst of it.

The MCM catalog has a notice stating that EPA regulations prohibit them from selling certain chemicals containing Class I CFC's without a tax-exemption number or business license. My Generation 2000 can apparently was one of these products.

I asked the salesclerk which compressed air products I could buy, and was cited some products, mostly Chemtronics E-series. These cost in the range of $10-$16, plus a $7 materials-handling fee. At a final cost of $17-$23 for a 12-oz. can, my friend understandably opted out.

On my last order to MCM, I sent for a Generation 2000 cleaner/lubricant, which *was* sent to me. Their ads mentioned the products were "safe for the ozone", thus I thought I should be able to buy from that series. It is _not_ made clear in the catalog which items are restricted and which are not.

When I brought this up, the clerk explained that the catalog (the latest version) had been printed up before certain new regulations went in effect. If I am to believe this, the EPA is very capricious on which chemicals to restrict, and that MCM can but merely blow in the wind. I'm not sure I believe this, but it does sound plausible.

Anyone who has fixed electronics for any length of time knows that some chemical products are indispensable. I live near the ocean, and as any coastal dweller can tell you, sea air and electrical contacts don't mix. I can't begin to mention how many pieces of equipment I would have to discard --in a landfill--if I didn't have some way of cleaning them.

Worse yet, I suspect that some of the "environmentally-friendly" subsitutes are downright dangerous: In that same MCM catalog, there's an ad for Chemtronics' Electro-Wash 2000 cleaner. In fine print on the bottom of the can, it reads: "DANGER!: EXTREMELY FLAMMABLE! LIQUID AND VAPOR MAY CAUSE FLASH FIRE!" Wonderful. Imagine having to use that stuff at home or worksite. We're supposed to think the (non-trivial) risk of fire is

preferable to the (questionable) risk to the ozone layer.

It's bad enough that I have to use acetone because rosin flux-remover is too expensive; I will NOT buy Chemtronics under these circumstances. Just imagine accidentally spraying the stuff into equipment you forgot to unplug!

I suspect it's no good complaining about this, as the EPA and the politicians would pat me on the head and say, "Gee, don't you think you should leave that stuff to the professionals?" :(And as for the business folks who have that extra paperwork to fill, I guess "that's tough, they can do it".

Must I stockpile chemicals? What are the chemicals I'm allowed to buy? Does anyone have a no-hassle source other than someone's back alley? Can you still buy Caig? Will I still be *allowed* to buy anything stronger than denatured alcohol?

> They look like overgrown BNC's. Anyone know what they are, and where I can
> buy some? (Maybe they're MHV's?)
> Finally, the case is stamped "Do Not Operate Without Airflow".

Steve-

There is a company called Pasternack Enterprises, Coaxial Products Division, that has C connectors and adapters in their catalog (1993 edition). They are at Post Office Box 16759, Irvine, CA 92713. Telephone (714)261-1920.

Guessing by the catalog pictures, C connectors may be about the size of type N or UHF connectors. If so, you may be able to replace them with something more common, especially if you don't need high power.

As far as airflow is concerned, are there any active components involved? What generates heat? If the multicoupler has only passive, high-Q components, the cooling air may have been required for very high RF power levels. For low power, it may not be needed.

: Alf NU8I/G4ABB

Alf:

Linear Technology makes a spiffy IC that would about fit the bill.
The LT-1070 is a boost mode switching regulator will handle about 5A.
All that is needed is a handful of resistors, capacitors, and a 150 uH
inductor capable of handling the current. The IC goes for about $5 or
so, I think.

They even give out little design program to run on your PC, to size
the caps and inductor for the current and ripple requirements. Since
you work in the industry, I bet a call to their local sales office
would get you a copy.

I've used the buck regulator (LT1074) to make a 5A battery charger
(the reverse of your situation), and been quite happy with it.

The DX book is worthwhile for the propagation section alone. They're
both great resources, buy them both, and the two volume Microwave set
as well. While a lot of the circuitry in the project section is based
on European components, the wealth of ideas is incredible. I've rarely
been disappointed buying a RSGB publication. The quality of writing is
also a large cut above the typical ARRL publication.

A thing not to do is to align a radio that hasn't had critical
frequency sensitive parts replaced. Alignment rarely, if ever,
drifts in commercial equipment.

...Dave>>

As a chemist, Dave, I would say stockpile. It won't be long before the average citizen (whether right or wrong) won't be able to buy any solvents. Buy compressed air that contains AIR, not chlorofluorocarbons. Acetone is probably a bigger hassle because it will melt the plastic casing on your rig and some of its components, as well as being a fire hazard.

Ideally you'd want to use a phoshor bronze strip. This is the stuff that they make finger stock out of. Has good memory - will retain tension to the contact. Also very conductive. You may be able to cut up a piece of finger stock to use the individual "fingers" for contacts. Or try a scrapyard. Brass has no

"memory". You put the battery in and the clip will open, and will stay open.
The battery will fall out.

Flammable / vs / ozone killing chemicals...

Acetone is probably a bigger hassle because it will melt the plastic
casing on your rig and some of its components, as well as being a fire
hazard.

We use rosin flux solvents, acetone, tf, ... Recently we switched to
Chemtronics (R) Flux-Off NR 2000.

DANGER EXTREMELY FLAMMABLE is printed in red on the front label.

I looked at the ingredients:

isopropanol (alcohol I believe, flammable)
ethanol " "
Ethyl acetate ? sounds like a gasoline additive
methanol ? the same stuff in auto racing fuel?
methyl isobutyl ketone ? Methanol? Iso-butane(cigerette lighter fuel)
Propane/isobutane I run my blowtorch on propane!

NICE STUFF!

WE TOOK A CAN OUT ON THE OUTSIDE BACK LOADING DOCK STEPS, SPRAYED A BUT ON
THE CEMENT AND LIT IT! IT MADE 1' HIGH FLAMES FROM A 2" SPOT ON THE CEMENT.

WE TRIED TO STOMP IT OUT, IT KEPT BURNING!!! UNTIL THE SPOT DISAPPEARED.

ONE CRAZY SPRAYED IT DIRECTLY ONTO THE FLAME - WOOSH - INSTANT BALL OF FIRE
ABOUT 4 FEET HIGH!

NICE STUFF!
I wonder if you could start the lawnmower with this stuff?

There has to be something less flammable to clean.

The current edition of the VHF Handbook is really quite out of date in places, and the long awaited revision ought to be a vast improvement - I'd agree about waiting, and in the meantime buy the DX book, which is pretty new. Unless you like valves.

The Microwave set - it is three volumes - with vol 3 having the band chapters in it - but from 1.3GHz upwards. From the RSGB, members can get a good deal on the set of 3 - about 25 UK pounds - from what I hear, US prices are somewhat inflated.

If you are trying to clean off the rosin from circuit boards, I have *HEARD* that methanol-based dry gas (for cars) will do the job.

There is another possibility, though, that might be even better. There are now electronic solders that use water-soluble flux. When I was working as an electronics technician for the physics department, we switched over to this stuff and actually liked it BETTER than the rosin core. It didn't scorch as easily, produced less smoke and the only thing we needed to de-flux the boards was a running hot water and a paint brush to gently scrub the board.

It DID have one drawback, though, in that if you didn't de-flux, it began to attack the copper, so I guess it is slightly acid. However, since hot water is REALLY cheap and easy to handle, it shouldn't be a problem to do a good job of the de-fluxing.

The stuff we used was called Hydro-X and we bought it from Newark Electronics.

-Bill VanRemmen, KA2WFJ

Certain packet nets in my area are using the AEA PK-96 packet controller
for 9600 baud communication. I've been thinking about building a DSP-
based modem that would implement the same modulation techniques used
in the PK-96. According to AEA literature this unit uses K9NG and G3RUH
compatible direct FM. Where are these techniques described?

Source record: 117019

Interesting... I too have a Ph.D. in electrical engineering (from the Univ of Michigan). I have built the Ramsey kit and had no problems at all. Actually, I received one of the first kits and they left out some resistors. This may not be very fair thoug
h since I also was an RF and general high frequency engineer for 15 years before getting my Ph.D. As such I have access to a very good lab and so was able to do more to the Ramsey kit than most kit builders.
At any rate, I don't think that you would have any problem. If you want a SSB rig than I suggest that you roll your own design. There are many new RF IC's available which make RF design more like stringing 7400 chips together all the time. For an SSB ra
dio I would recommend looking at either Harris, Maxim or RFmicRF microdevices for their integrated transmitter chips. Analog Devices is making a push in a big way and have a new receiver IC available with a complete synchronous detector.

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September 1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to note the rmgroup of rec.radio.amateur.packet, and to officially retire some (in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Quite simply, it is a glass tube (usually 1/4" in diameter) that has been
copper plated on the outside, with a thread adjustable inner part (piston)
that acts as the second plate of a capacitor.

The receiver multicoupler has a two-transistor RF preamp per output to make up for losses in the hybrid splitters. These transistors probably run at a high bias current for better IMD performance. (They are TO-5 cased, and have clip-on heatsink fins. Some have "TRW 02"markings on top.) The mechanical design of the enclosure for this beast does not provide for convection-cooling. It has only a small inlet slot on the right side, and a larger outlet slot on the left side.

I expect that the power dissipation isn't all that high, but without forced-air cooling, the transistors probably wouldn't last long.

Source record: 117036

Running FM in the LF (LowFER) band is pretty easy... but doing so
effectively depends on what you intend to do and how you intend to do it.

If you wish to go a short distance (a few miles at most, more likely, not
more than a block or two) then FM would be a dismal choice (I would
take it that you are talking about FM voice...) for several reasons:

- It takes up massive bandwidth. For standard 3 KHz deviation FM voice,
expect to require about 12 KHz or so. You can't do the old idea of "I don't
need 3 KHz deviation... If I deviate only 1 KHz or 500 Hz, then I'll take
a LOT less bandwidth..." If you think this will work, then re-read about
FM...
- If you FM is Ok (i.e. you can live with the wide bandwidth, the very
high noise levels (especially in urban areas...) (Oops... I meant to say
"If for you FM is OK...") then you have to consider the matching network.
A LowFER antenna system is typically a base-loaded tophatted vertical with a
VERY good ground system. As with any heavily-loaded antenna the loading
coil (in this example) is likely to be your primary loss factor. A wire
coil of heavy-guage wire (14 or 12) would work, but Litz wire (remember that?)
such as 12/40 (#12 with strands of #40) will work very well if its geometry
is appropriate (i.e. a basket-weave coil to minimize its distributed capacitance
which would spoil its Q, thereby efficiency...)
So, if you build a half-decent coil (to acheive half-decent power transfer)
then you are talking about very high Q. I ran some SSB on the Lowfer band
for a while and using a coil that wasn't really all that great, I could hear
'sideband cutting' as I tuned through resonance. In fact, I had to retune
if I changed from upper to lower sideband. The point is that an SSB signal
taking only 2.5 KHz or so *is* 'colored' by the tuning network. Imagine
what would happen (response-wise, not to mention phase-wise to an approx.
10 KHz wide FM signal...)

If it is voice communications that you want, there are lots of reasons why
SSB (or even AM...) may be better suited than FM on this band... That's
not saying that it can't be done, but one should keep in mind the contradicting
requirements/realities. There *are* ways to broaden the bandwidth at these
frequencies without killing efficiency (Radio Warsaw, Poland has an LF
transmitter in the 150 KHz range and it has typical european AM/LF broadcast
bandwidth on its transmissions, about 10-12 KHz or so, at least...) but
I'll be darned if I can remember how it was done, or where I saw its
desicription. A good book on all of this is 'VLF Radio Engineering' by Watt.
It was published in the late 60's and it is in most larger libraries...

1792. FOLLOWUP/RETRACTION: Electronic Chemical Blues

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-15 20:23:02 UTC
From: moisan@bronze.lcs.mit.edu
Message-ID: <306r76$ssu@bronze.lcs.mit.edu>
Source record: 117029
Cross-posted to: sci.electronics.repair,sci.electronics,rec.radio.amateur.homebrew

Thanks to those folks who suggested alternate chemicals and methods to use, but first, an apology: As Henry Spencer and a few others have pointed out, there isn't a conspiracy against individual servicers; my experiences were just due to some unfortunate timing on my and the EPA's part. Henry's quite right that the CFC regulations have affected large companies as well. (To the guy that called me empty-headed, I'm really sorry--I forgot about Halon.)

As Henry says, all CFC solvents are to be eliminated in a few years (1996?), and the existing chemicals are being slowly phased out. The current patchwork regulations of what can be sold to whom is a cause for much confusion and consternation for myself, others, and (I suspect) vendors such as MCM.

I don't care to argue the ozone matter; CFC's are going away, and I'm just trying to find subsitutes that are safe as possible for the ozone *and* myself. I'm not interested in stockpiling; I don't want to store large quantities of *any* chemical in my house.

I'm not necessarily averse to using petroleum-based products; as I mentioned previously, I use acetone (yes, people, I *know* it eats plastic! Voice of experience? Nah! :)) and isopropanol. Both of these are flammable, but I've been using them for awhile and I can (IMHO) control the risks. I'd like that any chemical I buy not have much more risk than the ones I mentioned. (I don't clean with kerosene; why should I bear the fire risk from a like solvent if I don't need to?)

One thing I thought of: Except for compressed air, why do we need aerosol cans at all? I usually use the cans to spray short bursts with an extension tube, or spray into a paper towel, foam swab or Q-tip. I'd be perfectly happy, for my purposes, with a pump-bottle. (I'm not sure this would work for freeze spray, but it's still one less can on my shelf.) If it removed the risk of a flammable propellant, I'd be relieved.

I'd recommend that *anyone* on this group who buys chemicals read the fine print on the can and ask questions, CFCs or not. There's an interesting article in the current issue of ELECTRONIC SERVICING AND TECHNOLOGY that covers this very subject, quite timely. ("Electronic Servicing for Performance and Reduced Environmental Impact", Dr. Mo Tazi, p.20)

Some time ago, I became the proud owner of a receiver built in the 1920s (?)
by an uncle of my father. I am told that it was built from a magazine article
and was called The Foreign Listeners Four because at that time it could receive
four foreign stations - from the UK.

It's a fascinating piece of Meccano built on a wooden board and housed in what
I think was once the case of a floor standing wind-up gramaphone. It consists
of four pin triodes with screw terminal bases and is hooked together with square
sectioned, rubber coated wire.

Can anyone give me any information on my fossil ? Or does anyone know a
living fossil who might of heard of it ?

What I'd really like to do is get it going again and to have a copy of the
original magazine article would be fascinating.

Please email me with replies as my access to News is only as reliable as the
next mod I make to the bridge I'm using.

Thanks

John

Those of you who build homebrew RF stuff know that variable capacitors are scarce. In applications which require one setting of a variable cap upon tuning up then never needs to be touched again I've been using trimmers. In particular, I've been using Radio Shack's mica trimmer, 95-420 pF 100VDC stock # 272-1339. They're in 80M and 30M transmitters I've built. But RS has discontinued to stock this item so I suggest you get what ever is left at your local store; they're on sale for $1.47 each.

Does anyone have any personal preferences for HF mixers with good
dynamic range?
Specifically are the very best mixers still discrete, or does someone make
an IC mixer with low enough noise to use in a First Class HF RX with a
preamp?
How good is the dynamic range??
Whats the IP3 point etc...

Thanks in advance!

This is not a chemistry newsgroup, but I guess you guys need to get this
out of your systems.

Ethyl acetate is an ester. Has a nice fruity smell and is a good solvent.
It can be made from vodka and vinegar under certain conditions.
Most fruit, flower, perfume, smells are esters.

Methyl isobutyl ketone is ...a ketone. Acetone is also a ketone with a
simpler structure. Ketones don't smell too nice but are powerful
solvents with lots of good uses.

Methanol is, of course, an alcohol. You don't drink it. Comes from pine
trees, but, nowadays most is made from natural gas.

All the above are good solvents and are flammable, but, no more hazardous
than gasoline.

We should all keep in mind what the people at DuPont have been advertising
for years, "Better things for better living through chemistry".

And we should all understand that very, very few things are dangerous until
a fool gets his hands on them; and, when that happens, almost anything
can be dangerous. I read much earlier in this thread where someone
described a flamability test on a solder flux cleaning solvent in which
he sprayed some on a burning cigarette. Would that same chap consider
his friend sane, if said friend went to the local gas station and let
loose with a stream of gasoline on a burning cigarette ?

Enough, OK ?

Just don't bother to even try to use them at even moderately high frequencies.
(At 6 meters they'd be ill. At 220MHz or above they are death.)

Someone at Rockwell had designed a 20 watt transistor amp for a project we had.
It used mica compression trimmers at 240MHz. It was a bear to tune up and
performed rather poorly. Another engineer removed the compression trimmers
and put in Johansen ceramic slug type trimmers. (Not the little round pills.)
He took out the driver stage and one of the two transistors in the PA. When
tuned up it gave more power output for less power input. I get amazed every
time I open something that is supposed to work at frequencies above 200Mhz
and see such beasties. (I note that the 35 watt PA in the 450MHz Syntor I
have has one. <sigh>)

Help!

I recently purchased a used Tempo (Henry) 2002 2 meter kilowatt amplifier.
(Uses a pair of 8874 tubes in push-pull)

The amp was custom built by Henry to operate on 194 MHz. (It was used in an
MRI lab.) I'd like to move the amp back down to 144 MHz.

I have the only technical manaul available, which covers the 2002, 2006,
and 6N2. It has a schematic diagram of the amp, but does not provide the
dimensions of the tank coil, (a "U" shaped section of 3/4" tubing)
or any diagram or pictorial of the input circuitry.

Because it's not their current model, Henry refuses to service it,
won't sell me parts, or provide any help of any kind.

Does anyone out there have a Tempo 2002, or have experience
servicing one?

Thanks;

Dave Quick WD0EKL

Ken,
Rolling your own, as you have proposed, was at one time a very common thing
to do. The further back you go in earlier editions of the ARRL handbook, the
more info you will find. Start at about 30 years ago and work backwards.
There have also been several good items in QST on the subject, especially
those by McCoy, W1ICP, in the '50s-'60s.
Good luck, Kurt, N2TTE

From: ka7oei@uugate.wa7slg.ampr.ORG
Message-ID: <93699@uugate.wa7slg.ampr.org>
Source record: 117046

For my money, I would stick with diode-ring DBM's. You will come out
FAR ahead with something like an SRA-1 or an SBL-1 (Mini-Circuits)
than with something like an NE-602 or an MC1496.

The problem with the active mixer IC's is that they have some gain. On
HF, you end up with monstrous signals at times, usually enough to cause
some of the IC mixers to wilt in their presence.

The mistake made by many people is to put too much gain in front of the
mixers. For example, the NE602 has a fair amount of gain intrinsic to
its gilbert-cell mixer, and an unnecessarily low noise figure to boot.
For good performance, you would want to balance pre-mixer gain and
noise figure appropriately.

When it comes to HF, the noise figure of a single diode-ring mixer (which
can be used to get a system noise figure of 7-9 db) is plenty low to
hear any signal that is there (assuming that your antenna is half-decent.)
on HF. Therefore, right off, it is going to reduce signal-handling
capability and NOT improve receiver sensitivity if you were to put a preamp
in front of it. You'd just hear the atmospheric noise louder if you
did put one inline. An exception to this might be if you were using
a minimal antenna (mobile whip, etc.) where the signals are diminished
by the nature of your antenna.

Of course, DBM's are not quite as easy to use as some of the IC's. You
need to pay attention to matching at all 3 ports. The converted
signal out of the IC is usually a higher level (it will be 6 or so db lower
than the original RF going in...)

There is an excellent receiver design in the 1981 Radio Amateur's Handbook
(I *think* that that was the year... Its red, anyway) - actually its
a tiny transciever (Direct Conversion) but it shows some techniques
for using DBM's.

I've had good luck using high quality porcelain chip capacitors in
parallel with air variable trimmers, at least at lower frequencies.

However, be careful when modifying such circuits. Sometimes the
high loss is needed for stability--though you might be able to
add a resistor to restore maintain stability.

In my more curmudgeonly moments I find it hard to believe people can
think clearly if they can't write clearly. I see writing as simply
an extension of the art of thinking. Just as you might not trust an
architect to design a house if he had trouble drawing his designs
on paper.

Ideally you'd want to use a phoshor bronze strip. This is the stuff that they make finger stock out of. Has good memory - will retain tension to the contact. Also very conductive. You may be able to cut up a piece of finger stock to use the individual "fingers" for contacts. Or try a scrapyard. Brass has no "memory". You put the battery in and the clip will open, and will stay open. The battery will fall out.

...Munging Until No Good...

Joe,

I thought I'd found a solution because over the weekend, I found brass shim stock made by K & S Engineering Company at a local hobby store, Eric Fuchs in the Burlington Mall. But your point is valid about the springiness of brass.

But ... what is finger stock ? What kind of stores carry it ?

Thanks,

That's right, I'm building a Heathkit HW-9 QRP rig. I bought it about 7 years ago, and I thought it had been lost before I got around to building it. Well, it was found, and I'm working on it, but about half the parts from "package 2" (the non-taped parts) are missing. Anyone think there's any way to find these parts, short of buying new replacements, one-by one? If so, any ideas about the best place to find these parts?

Also, I keeo hearing mention of either a QRP mailing list or newsgroup; Could someone direct me there? Thanks!

OK. Thanks Kurt. I have a '66 (I think) and a '68 handbook somewhere around here in a box. I have this feeling that I'm going to have to be looking up a local old timer with a well stocked library, though... :) Thank you sir.

Wow, that would be one TALL antenna on 80m, huh?! I'm working on collecting the parts and such for a 1/2 size G5RV to put up over my house. I have all but the pieces to anchor the ends and I have about $9 invested so far. ;-)

The QRP email list is a wonderful forum. To subscribe send an email to:
majordomo@think.com
and only write:
subscribe qrp
or:
subscribe qrp-digest
and within a few minutes you'll receive an email from think.com
welcoming you to the net. Note that the digest will consist of
all the day's articles sent in bulk; otherwise you'll receive
each article as a seperate email. Expect about 20 articles
per day. There's some famous folks on the list - plenty of
help available for any problem you might have regarding:
antennas, homebrew, kits, and any other qrp-related items.

Jeff,
The classic J-pole design is a monobander. Most trapped multiband verticals, I have had experience with work slightly better than a Cantenna (dummy load). Most monoband verticals (full 1/4 wave or longer) verticals with lots of ground radials (more than 20) have worked well for me. I have not tried the Cushcraft R5 or R7 but these seem to get mixed reviews (rec.radio.amateur.antennas).

Unfortunately this probably does not solve your limited space problem. Have you considered a short G5RV or an inverted vee fed with open wire (450 ohm) ladder line and a balanced line tuner?

>email: harrisok@sonoma.edu

Yes, mineral oil is a little expensive and is probably the
safest to use in a dummy load. Don't try anything like motor
oil, it has many different types of lubricants that have
different volatility. The 'best' type of oil is "turbine oil."
You can get it at many farm and ranch supply stores. One of the
easiest to find is sold by TEXACO distributors, Regal Oil R&O Number
46. You can usually find it in 5 gallon cans sold as "turbine oil."
I don't know how easy it will be for you to find where you are. Just
go out to one of the small towns in your area.

I used mineral oil in mine. I got it at K-Mart at about $1/pint. The check-out person gave me a funny look when I bought 8 bottles. Then I realized what it's often used for (constipation:-).

Be aware that you have to de-rate the dummy load if you use drug-store mineral oil. The transformer oil (be sure it's non-PCB) or the Texaco Turbine Oil is a better choice if you're going to run a lot of power into the dummy load. The Heath Cantenna has different rating curves for the different types of oil. For your basic 100W transceiver, the K-Mart stuff is fine but for tuning your kW linear, get the other stuff.

That would be a type 5800 Johanson cap. They are available from Electrosonic in Toronto, Canada. BUT...(there is ALWAYS a but) Their latest catalog lists them at $16.34 for 1-24 quantity. Thats roughly $11.60 in Yankee dollars. If you can stomach that kind of price tag, their number is (416) 494-1555, ask for the order desk. BTW the price has almost certainly risen slightly :-)

Good luck,

Mark

1822. Building a house: Special Considerations?

Message-ID: <Ct5A12.3x7@wybbs.mi.org>
Source record: 117131

I am building a 1.5 story house, with a walkout basement, starting
next month. Anyone have any good ideas regarding building a new
house and amateur radio?

So far I've thought up of the following, and would appreciate
anyone's comments:

Grounding Rod: Punched in before basement cement is poured.
Should it be isolated from the basement floor?
(soil is sand, high water table (South west shorline michigan)

Antennas in roof:
Can you lay a antenna on the roof, before laying down shingles, or
underlayment, or whatever? Would you have to limit your RF output?
I'll have vaulted ceilings, so there's no real attic.

Cable runs: As the walls go up, what cable runs should I make up
them? The shack will be in the basement, and I'd like to run
a nice piece of coax up, with a remote antenna switch.

Ken:
On rewinding power transformers: You might look seriously at some of the power toroids for ease of rewinding. I have never tried it but at the local surplus place they usually have several varieties of power toroids. If the secondary is on top of the primary it should be fairly easy to get to the secondaries to rewind them. The other advantage (as these are usually high voltage secondaries) is that you can rewind them with much larger wire with a more manageable number of turns. The biggest problem will probably be getting the old secondary off.

>

I have modified transformers at times with good results. Maybe some
knowledgeable person can shed more light on the subject. The following
relates my experience only. Your mileage may vary 8). All disclaimers
apply. I am assuming you have related knowledge and feel competent
doing something like that...

Assumptions:
0) You are not trying to put together a transformer from scratch!
The most difficult part of doing is finding out about the core material
(magnetic properties) which seems impossible to find for an old
transformer.

1) What you intend to modify, is an ordinary non-saturating core xformer
with its primary being fed from an AC outlet (110 and/or 220 volt
household supply), and you don't intend to mess with the primary.

2) It is not an "autotransformer" - i.e., its primary winding(s) are
separate from its secondary winding(s), there is no electrical
connection between the two.

3) The intent is to vary the secondary voltage *somewhat*, for example ,
you are not trying to have a 40 volt secondary put out 800 volts.
(not only that may be physically impossible for a given geometry,
it may have repercussions regarding breakdown voltages, heat
dissipation and such.)

4) You *know* the power rating of the transformer's secondary (BTW, I'm
theoretically not inclined, or challenged depending on how you look at it.)
You know for example that the secondary supplies say 12 volts at 2.5
amps max. (AC, RMS, given Frequency, pure sinusoid, constant phase,
etc. etc.)

Opening up a transformer is best left as an exercise for the reader!
If it is dipped in tar(!?), I'd say forget it.
Don't scratch or bend the strips. They are laminated for a reason.
If you pry them off carelessly and damage the lamination/coating or bend them,
you are likely to affect the power handling, cause the core to heat up more
than it is supposed to, and/or make the xformer "buzz". A
practice run on a small low-power transformer maybe worthwhile.

The basic idea is to get what is called "turns per volt" for the secondary
(# of turns that give 1 volt at the secondary.) The reverse (i.e., voltage
per single turn) will also work but I think is less accurate unless you're
in a lab environment.)
It may involve some guessing initially, and the more experience you
have, the better your guess will be. Try to estimate, by looking at the
secondary winding how many turns it has.
A rough guess is fine. Divide that by the secondary's voltage.
Then wrap *neatly* the number of turns that you calculate, to produce say
a couple of volts or so. Another method that's more accurate, is
to unwind (a) secondary completely, and count the number of turns,
and then do the division. I am almost sure there are some nonlinearities
in practice, but for the most part, the relationship is linear and
gives a good approximation. If you wrap n turns, you get m volts.

Using the information, you can wrap your experimental winding, preferably
for a few volts. Write down your exact # of turns. Then put back the whole
thing (carefully). All of the strips should be put back. And the whole
thing should be neat and tidy. I have used electrical tape to hold the
temporary secondary (experimental) winding. If you left the original
secondary winding in place, your experimental secondary could
be wrapped on top of it (space permitting). Then connect the primary and
measure with a good voltmeter, the voltage of your experimental winding.
A high valued resistor as a load on the secondary to draw a few milliamps may
be good idea too. Get a second estimate of the turns per volt by dividing
the # of turns by voltage. Then, calculate the number of turns you need to wrap
for your new secondary (# turns= turns per volt value * desired voltage.)
Keep in mind the space limitations for winding extra wire if that's what's
needed. Open up the thing again, remove the experimental winding.

If you intend to increase the voltage, you must derate the current the
secondary can supply. Moving too much above or below what the transformer
was designed for is in my opinion not a good idea, and it's kind of hard
to tell what those limits are when no data is available. Another concern
is the space you have for re-wrapping the wire. The most important
thing, however, is to keep the power rating of the xformer the same. Example:

Originally: secondary 10 volts, with max current 2.5 amps.
New desired secondary voltage: 17 volts.
P orig = 10 * 2.5 (RMS values) = 25 watts.
(or maybe we should talk about Volt-Amperes instead of watts -:) -:))
New max secondary current = 25 / 17 = about 1.4 amps.
So at 17 volts you should not expect to draw more than about 1.4 amps.

[This space is left for theoretical gurus. Please go ahead.]

The estimated max current gives you an idea of the wire gauge you need.
Use fresh wire of a diameter that can handle the current you need the
secondary to supply. Look at tables (for example in the arrl handbook) that
show the values for various gauges of copper wire, and be as conservative
as possible (i.e., use larger diameter wire - if there is enough space for
the whole winding).

footnote: There is an iterative process here if you want to determine the
limits, because you can increase the voltage (when not demanding high
current) and use thinner wire and that in turn may buy more winding space.)
The inverse is also true. (Sometimes there are tables that can be used to
estimate how many strands of wire of a given gauge can be put side-by-side in
a given cross-sectional area.)

Of course if you intend to lower the voltage, your max current capacity goes
up, and if that's what you want, you need larger gauge wire. There is a
limit as to how much current can be drawn with a given xformer before
saturating the core material, overheating and the associated anomalies.
Deviating with a few percent of the rating may be ok.

Wrap the winding tight and with care, so as *not to nick the lamination of
the wire*. Put Q-dope or use a good quality insulating varnish over each
layer. For higher voltages, it is essential to use a varnish with high
dielectric properties (high breakdown voltage) or else one layer may arc
over to another. You may even have to have "varnished paper" insulation
between layers. Put back the final wrapping insulating "papers", etc.
BTW: can someone point to a source of that paper/wrapping material ?

After a couple of times, you can skip the trial winding too.
I usually wrap a few more turns, put the thing together, measure the voltage,
and trim as necessary before finishing up.

All comments and corrections welcome - I don't rewind transformers that often!!!

** Be careful and use applicable precautions and good judgment when around
lethal voltages (or should I say currents,... or power -:)) **

Good Luck,

/siamack

In my origional post I said I wanted any information of IC mixers
that would be good for use on the HF bands with a preamp.
(That was I stupid request!!!! On the HF bands Dynamic range is more
important
than noise figure!!!! so no preamp.)
That was a typeo I ment with out a preamp. Like the block diagram in the
QST recieveier article.

Has anyone used the new mixer from analog devices?
It has a SSB noise figure of 20dB and a dynamic range of 100+ dB
Is this noise figure of 20dB Good enough for 10 and 15M?

Also how do you convert from or between noise figures specified as:
SSB dB
nv/Root Hz
and Temperature???

Thanks in advance

Try the hamfests. I live in the Washington DC/Baltimore metro area, with many hamfests throughout the year and the larger ones usually have at least one dealer who sells them. The going price is usually in the $2 range, and they usually have large bins of them, apparently in unused condition. Hint--check the dealers who traffic in used microwave goodies; they would probably be the most likely ones to have them. (For the last two or so years now, there has also been one rather large surplus dealer at the local hamfests who sells SBL-1 DBMs by Mini Circuits Labs at 2 for $5; most are unused, some are unsoldered, all have tested good. I'm not at liberty to say how many I bought since my wife might see a printout of this, but we'll just leave it at "dozens"!) 73 de WA8MCQ

My experience with dummy loads has shown that the cheapest and most
efficient oil to to use is Transformer oil. This is the oil used in
distribution transformers, as used by your power utility companies in the
USA. This is the same oil that we use in our oil-cooled welders here in
South Africa. I am sure you must have the same critter over there!

The oil in the dummy load is ostensibly used for cooling/heat dissapation,
and this what the oil in transformers and welders is there for.

Hope this info is useful to someone!!

>Thanks in advance
>Paul Breed KL7JG

SSB dB is nonsense salesjargon, IMHO.

nv/Root Hz and temperature are related by the Boltzmann equation.
Essentially noise power = kTB, which at room temperture is about -173.85dBm/Hz.
Once you have that value you can calculate all the other values you want by
playing with absolute temperature ratios and things like power = E^2/R
relations.

The noise temperature of a receiver is related to how much noise you get out
of the receiver with a standard "physics class" noiseless source the same
impedance as it usually connected. The noise figure is related to the sum
of the source resistor noise plus the excess receiver noise divided by
the source resistor noise. A noiseless receiver has a VERY low noise
temperature and a noise figure very close to unity.
So lemme see here.... 10^-20.385 (to make it watts) ~= 4*10^-21 = E^2/50.
This means E^2 = 50*4*10^-21 = 2*10^-19 volts squared. Thus a bare room temp
50 ohm resistor generates about .4nV/Root Hz noise. In a 2400Hz SSB bandwidth
this means about .022uV of noise in a 0dB noise figure receiver. In a 3dB NF
receiver that'd be maybe .031uV of noise. For all the good that will do.
(I suppose it means you can place a 50 ohm signal generator witl attenuators
on the receiver input and enjoy a 20dB SNR on a CW signal in the SSB passband
with a 0.3uV signal. All of which is meaningless for SSB usage and also
meaningless for normal usages on HF. For HF usage with dipoles or gain antennas
you want a frequency sensitive attenuator in front of the receiver with

perhaps the 3dB corner at 30MHz and attenuation rising about 6dB per octave as the frequency goes down. And even THAT may be underkill in most urban locations. That attenuator will do WONDERS for practical IMD performance on any receiver, by the way.)

>Could someone point me the right direction to finding information about
>"rolling my own" power transformer?

If you have a lot of time on your hands, go for it. I found a junk transformer at a flea market and decided to try to re-wind it for my own needs. I'm still working on it...

First problem is getting it apart. Mine was potted (soaked in varnish), so just unwinding the windings was out. I had to disassemble the core by unbolting it and tapping a knife blade in between the laminations, one at a time.

Next, start unwinding. Mine had several windings of various voltages, all about 1 amp output. The potted wire gets trashed by the unwinding process, so plan to buy new wire - Amidon has large gauge "enameled" wire. You count turns as you unwind. You will, of course, have measured each winding for it's output voltage before you started any of this. From the number of turns you get volts/turn for the transformer.

If you're lucky, your transformer will have the primary winding at the inside, so you're all set once you get the secondary off. Figure out how many turns you want, and start in. This is where I left off - you have to anchor the windings somehow or they'll start to turn into a tangled mess once you get going. I didn't realize that, so now I'll probably have to unwind it and re-do it. You wind in layers, seperating each layer with a wrapping of tape or waxed paper. You don't really want the layers to be in direct contact, to avoid any possibility of shorts. The tangled mess mentioned above puts them in direct contact... Anyway, mine will be 21V at 10A eventually.

All of this is really easy to do, just rather tedious. Beats $95 transformers.

See the ARRL Handbook for information on: transformer size, wire gauge choice, power supply design factors, etc.

Can I butt in? This topic is very interesting to me, because I'm a research scientist (psychology) as well as a textbook author, so I get to practice two different kinds of writing.

Scientific writing, as we practice it in our journals, and as is found in most conference proceedings, has as its objectives clarity, completeness, and objectivity. As everyone knows, it tends to run to long, complex sentences, passive voice, depersonalized construction, etc. Much of what I read in QST, and many of our most popular books, like those by Doug DeMaw and Wes Hayward, are written is some version or other of "science-ese." The disadvantages of this kind of writing are that it is "flaccid," "lacks energy," and is just plain dull.

Good textbook writing is, in my opinion, harder. In addition to trying to be clear and complete, you also have to be interesting. That means, among other things, a lot of variation in sentence length, and a strong preference for the active voice. It is so EASY to write, "In this study, the children were presented with xyz stimuli, then required to do abc in response." It is so much less natural for a scientist, but so much more engaging, to write, "In this study, the children saw xyz, and responded with abc."

I guess it's true that a good editor could convert the one to the other, but I can tell you for sure, mine doesn't have time to do so. We talk from time to time about rhetorical strategies, but getting it right is on my nose, not his.

If I had to recommend one short book that has taught me more about writing than anything else I've ever read, it would be, Strunk and White's _Elements of Style_. (That's E.B. White, of _Charlotte's Web_ fame.)

Source record: 117120

It's much easier than you might think.

Find a scrap toroidal transformer with the primary voltages and overall power rating you want.

Usually the secondary windings are on top and can be carefully unwound without disturbing the high voltage winding or its safety insulation. If you measured the secondary voltage and counted its turns, you will know the recipe for creating your new secondary.

If you want two separate, identical secondaries, wind them together with doubled wire to get matched wire lengths and so matched resistances.

No messing with laminations, no problems restacking. A bit fiddly to wind, though.

Score A++ for amateur spirit!

Message-ID: <9406197746.AA774640505@mails.imed.com>
Source record: 117122

To Paul Breed:

The conversion from NF to temperature and vice vesa is on page 12-2
of 1988 and 1985 ARRL handbook (and presumably newer versions):

Te = 290[antilog(NF/10)] in degrees Kelvin

NF = 10 log(1+(Te/290)) where Te is degrees Kelvin

The ISD2590 chip from Information Storage Devices is a nifty little chip for a project I'm working on, but I can't seem to find one.

JAMECO lists it in their catalog, and accepted an order for one, but then advised that it would not ship for SIX MONTHS and cancelled the order. None of the other low-volume part vendors seem to have it available.

Anyone know of any sources for this chip? It'll probably be around $40. I only need one.

Can someone point me to any construction articles on VHF SWR meters? It doesn't have to be fancy, or even provide any calibrated power readings; the only requirements are that it works on 2 meters and is useable at low powers, in the 2 to 6 watt range (for an HT). I only need something to trim antennas.

Before anyone suggests the $40 one from Radio Shack, it's been discontinued.

I have been experimenting with AM on 184.3 Khz. I use a 1.843 Mhz TTL
oscillator connected to a 4017 decade counter chip to generate
the carrier, which I then filter and modulate and amplify and into the antenna.
It sounds good on the receiver but no matter what I use as an antenna or how
much power I put into my output stage It doesn't go further than around the
block. I wonder if this frequency is by nature not as strong as CB for example.
I use a water pipe as ground and a fence as an antenna. I wonder if a variable
transformer (similar to a variac but for 100Khz) would help.
If I seem a little weird its because I am an expert on computers but I can't
build a radio. (I can build a computer though). I
would like to see how your project turns out. One more question though, is it
IMPOSSIBLE to make an effective LF HT?

1842. Re: SUMMARY DSP algorithms

I have a somewhat irrelevant question about DSP algorithms.
Would you be able to explain in simplest possible terms how a FFT or inverse is performed? For example , I know that a DFT gives you the amplitude of a frequency in a sample as the sum of all the samples multiplied by sine or cosine functions of said frequency.
In a textbook I saw a diagram of a FFT. The samples were added and subtracted from one another in an interesting pattern and occasionally multiplied by a "weighting function" which had e and i in it and I could not calculate.
If I could understand that weighting function enough to write it in BASIC that would help alot.
It amazes me that when the FFT is done the samples have been magically replaced by amplitudes of frequencies. How does it do that?

Just to avoid confusion: what is used here is the HamComm interface, but
the program you need for FAX/SSTV is JVFAX 6.0 written by DK8JV.

HamComm 3.0 does CW/RTTY/AMTOR with the same circuit.

Typo somewhere:

NF = 10 log(1+(Te/290))
NF/10 = log(1+Te/290))
antilog((NF/10) = 1 + Te/290
290 antilog(NF/10) = 290 +Te
290 (antilog(NF/10) - 1) = Te

Speaking at someone who wrote some chapters in the RSGB uW handbooks,
and did the typesetting for them ...

One of the biggest problems was getting those who knew best about
particular subjects to spend the time writing about them for the
handbooks. To give you an idea, the titles of chapters were first
defined in the early 1980's. It took about 5 years to get all the
chapters for the first volume written! Some chapters then needed more
work than others to produce a reasonable style and this all took
best part of a year [by a volunteer, editor Mike Dixon]. Even then,
some would say the style is still a little too "science-ese", but
to an extent, we had a RSGB style guide to follow, eg must use
antenna, not aerial, and so on.

The later volumes (2, 3) followed on a bit quicker, but it really is hard
work to get the material in a nice readable format, if the author does
not do it. Many of those at the forefront of technical development
do not naturaly write in a nice readable format, and often see nothing
wrong with the "science-ese". I personally find I have to go over my
first draft and try crossing out say 1/3 of the words! Often nothing
is lost, and it can be turned into something much more readable!

However, the process can take so long that the latest material is
not in there. Eg RSGB uW HB vol 1 ch 6, GaAs FETs - info about the
earlier devices is there, but latest about HEMTs is not - it was
all written about 1985!

Zack is right about the technical conference proceedings being the
best place to get the latest technical info. Some of the ARRL microwave

ones are really good. But you don't get a book for beginners, instead a collection of papers for those already well into the subject. I think there is a place for both types of book.

Steve:
I have had VERY good results with a homebrew microstripline directional coupler. You use 2 pieces of single-sided PC board, etch a 50-ohm trace on one piece and use the other piece as the ground plane. you then glue the un-clad sides together to make a sandwhich that has two FINE (like 40-guage) pickup wires between them. I use 1N34A Ge diodes and 15-turn trimpots as the load on the other end.

Is this enough details for you? I posted a more detailed description a couple months ago, but I didn't bother to save it. If someone out there has it and wants to repost it, please do. If not, I will write it up in more detail if you or others need it...

1849. VHF directional Coupler/ SWR meter

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-20 16:21:33 UTC
From: BILLY@urhep.pas.rochester.edu
Message-ID: <1994Jul20.162133.10764@galileo.cc.rochester.edu>
Source record: 117138

Gee, I was wrong, I DID save it...

I have had good success with stripline directional couplers at 2 meters and 430MHz. You make 2 single sided PC boards about 3 inches long and 2 inches wide. Calculate the width of a 50-ohm trace at TWICE the thickness of the PC board you are making. This is because you are going to make a sandwich with copper on the outside.

Etch an appropriately-wide trace down the length of the middle of the first board. On 1/16 inch FR-4 or G-10 that's 0.22 inch. Now comes the tricky part. You want to lay two fine wires between the trace and the ground plane, that is, in the middle of the sandwich, and have the ends poke through the ground plane without shorting to it. Drill 2 pairs of tiny holes about 3/4 inch from the ends of the GROUND PLANE BOARD and spaced about 1/16 inch apart. They should be centered on the board so that they will lay under the trace when the sandwich is assembled......

```
+-----------------------------------------------------+
| |
| |
|- - - - - - - - - - - - - - - - - - - -|
| : : | <- trace
|- - - - - - - - - - - - - - - - - - - -|
| |
| |
+-----------------------------------------------------+
^ ^
|---- pairs of holes ----|
```

Use a larger drill bit to remove the copper from around the holes to form relief areas to avoid shorting.

Run some fine magnet wire lengthwise between the pairs of holes to form two pickup loops running parallel to the trace on the substrate side of the ground plane board.

Now you are ready to glue the sandwich together. The first time I did this, I used RTV. 5-minute epoxy would works better. Just pull the loops tight so they are straight, spread the glue on the substrate side of the ground plane board, and clamp the trace board in place and wait until the glue dries/cures. Of course, the copper sides should be OUT and the substrate sides should be glued together...

End View

```
------------ trace
############################################## substrate
```

```
~~~~~~~~~~~~~~~~~~.~~.~~~~~~~~~~~~~~~~~~~ glue and wires
################################################## substrate
-------------------------------------------- ground plane
| | wires sticking out
```

Now you can put your diodes and terminating resistors on in the normal way.
One loop will be forward energy and the other will be reflected.

```
+-----------------------------------------------------+
| |
| |
| For. -|<- -/\/\/-* |
IN -> | : : | OUT ->
| *-/\/\/- ->|- Ref. |
| |
| |
+-----------------------------------------------------+
```

I suggest using a 10-turn trimpot of about 100 ohms as the terminating
resistor. This way it is easy to calibrate it without knowing the
characteristic impedance of the loops.

Solder BNC or N connectors to the ends of the directional coupler and your
metering circuit to the reflected connection. Apply power to the input with
the output terminated in a HIGH QUALITY 50 ohm dummy load. Adjust the
reflected trimpot for minimum reading on the meter. Reverse all connections
and tweak the forward loop in the same way.

You are more or less ready to rock and roll...

>-=-

The best idea is to put in one or two runs of 2" electrical conduit
from the rooftop to your shack location. That way it will be available
for future use. 2" might seem a bit large but it makes it easy to
fish a RG-213 cable with connectors on it through a pipe that may
already have a cable or two in it.

When extending your ground to the shack, use the biggest (ie: lowest
impedance) wire you can afford or better still use 1/2" copper pipe.

Lastly, run two separate 120V circuits to the shack and mount the
outlets at desk height. If you use #12 wire then you can always
change one circuit to a 20A or 250V if the need arises (check local
codes first).

One final thought: If you can possibly afford it hire a contractor to
do all the work :-) I've been QRT since April working on renovating
my house and doing all the work myself :-(

In several of the ARRL pubs (VHF manual, probably the FM and repeaters manual, maybe even the handbook) there's a "plumber's delight" directional coupler described. You need some way to get a known 1:1 SWR to calibrate it for directivity, and some sort of accurate power meter to calibrate for power, but if you can do that (and at least the 1:1 should be pretty easy if you have a long piece of lossy cable of the impedance you want to calibrate for), it should provide good accuracy. It works very much like the Bird meters, with a "slug" that fits into the line. The line is made from copper tubing fittings: a "T" is used to insert the probe into the line. Since half the work (or more) of making one is getting the parts and figuring out how to put them all together, it should be only marginally more effort to do a pair, and that would let you monitor both forward and reflected at the same time, and you could put that info into a calculating SWR circuit, to directly display SWR instead of fwd and refl powers.

[del]

>SSB dB is nonsense salesjargon, IMHO.

[del]

Sorry Joanne, I dont agree with that. SSB noise figure has
nothing to do with SSB as a transmission mode (vs AM or CW)
but rather refers to the fact that there are images to any
mixing operation. eg. If the IF is 9MHz and the LO is 135MHz,
the rx will receive energy from both 144 and 126 MHz. Thus
the noise power will be double in the DSB case, ie the noise
figure would be 3dB higher than the SSB case. This is why the
manufacturers usually quote the SSB figure, because it is
lower. It assumes that you will provide adequate filtering
to remove the undesired image _prior_ to the mixer.

BTW, the noise figure, per se, is not related to bandwidth.
The noise power, hence s/n ratio is.

The coax will need replacement before the house, and your needs will change over time. I'd suggest you put as straight a piece of 1-1/2" or 2" conduit in as you can. The PVC conduit isn't too expensive and should be OK for this application as long as you don't try to run your coax too hot (don't try to run 1kW through RG-213 at 1GHz ;-). Depending on your yard, you might also put in a piece of conduit from the planned operating position to the back yard. I've found that the 100 foot continuous lengths of black polyethelene pipe make decent underground conduit for coax, but you do have to be careful of low spots that will accumulate water (through condensation if not through direct ingress of liquid at the ends).

>-Steve N8KWV

The easiest one I've ever built used about a 12inch length of
RG58. Strip off the outer plastic cover. Get a couple of lengths of thin
insulated wire (~22awg) and a darning needle. Thread each length down the
cable, between the braid and the inner insulation. Put a small 250ohm pot at
opposite ends of each wire down to braid to act as terminations,
and on the other ends put series diode (1N914 or sim. works fine)
then 470pF cap down to the braid. Use abt 100uA meter and 5k series variable
resitor switched between the two diode outputs. Assuming you have a good 50
ohm load, (If not, a 1/2w 47 ohm resistor looks real close at 144), adjust
each 250R pot for loweset reading in the reverse direction.

This arrangement works great at the 1 - 10 watt range. For higher powers use
RG8 and a shorter length.

I can't give you the original reference, 'cos I first saw this many years
ago, probably in a European publication.

Let me know if you have any questions.

The old transformer oil had in it a substance called

"Polychlorinated Biphenyls" a.k.a. P.C.B.'s

which are a known carcinogen. Transformer oil hasn't
contained PCB's for some years, but there are MANY older
transformers in service that DO contain PCB-contaminated
oil. Not hazardous unless it leaks, but don't use it in
a dummy load.

See QST, April, 1994 for answers to most of your questions. It has a picture
of a homebrew lowfer on the front, and an article about the design and
regs. No license, but a limit of 1 Watt, and a limit of 50 feet length for
the antenna. That is pretty short considering the wavelengths involved.
That is for the 160-190 MHz band. The medfer band is 510 to 1750 Mhz
(I think) and the power limit is 100 milliwats (I think), and an antenna
max length of about 10 feet, again pretty short. The length limits are
actually 15 and 3 meters, but they come out close to 50 and 10 feet.

Here is part 15.217 of the FCC regulations.

15.217 Operation in the band 160 - 190 kHz

(a) The total input power to the final radio frequency stage (exclusive
of filament or heater power) shall not exceed one watt.

(b) The total length of the transmission line, antenna, and ground lead
(if used) shall not exceed 15 meters.

(c) All emissions below 160 kHz or above 190 kHz shall be attenuated at
least 20 db below the level of the unmodulated carrier. Determination
of compliance with the 20 dB attenuation specifaction may be based
on measurements at the intentional radiator's antenna output terminal
unless the intentional radiator uses a permanently attached antenna, in
which case compliance shall be demonstrated by measuring the radiated
emissions.

Part 15 allows exemption from the type acceptance requirements for hobby
and protoype purposes for a limited number of units but you still must
adhere to good engineering design, construction and alignment practices.

Hi,

I am looking for information on how to build a serial cable
for my Kenwood TS-50. Kenwood wants $100 and MFJ is now
selling one for $50. After saving for over a year for the radio
I really can't spend even $50. Since MFJ is making one, it can't
be too hard. If anyone can tell me how, I would really appreciate
it. Also, if possible I would like to know how to talk to the radio
after building a cable. Does anyone have this information?

Please respond by e-mail so that I can summarize for everyone else.
Also, my news feed only works occasionaly and I might miss a general
response.

My address is: levin@cosmic.physics.utah.edu

Thanks in advance.

I'll pass along two suggestions if you're building. Both are things
I'm looking at myself as my wife and I lay out our own plans for some
serious renovation next year.

1. If you're going to have heavy equipment out there digging and
pouring foundations, that's the time, if ever there was one,
to think about doing a tower. The incremental cost of asking
the backhoe operator to dig a little more and the concrete guys
to bring out a few more yards is nothing against what it'd cost
as a separate project.

2. Put a cable chase up thru the core of the building if it's a
multi-story. Running cables up from the basement to the attic
of a two-story is certainly do-able (we've done it) but not
fun. Even if there's a way to do it, there are often all
kinds of places where the cable can snag, totally out of
reach. In our renovation, I expect to just run 4" PVC up
thru the core of the building. The nice smooth walls of
the pipe should make running cables a whole lot easier.

This would be a good time to make sure that you have enough power running to your shack. A 220V line would be useful for a linear. The 120V lines should have enough current capacity to handle any anticipated equipment with capacity to spare. It is cheap now but as a special job, good luck.

Because of this particular limitation many experimenters place the
xmtr directly at the base of the antenna (no transmission line).

>transformer (similar to a variac but for 100Khz) would help.

At this frequency, vertical antennas work much better than low long wires,
actually *short* wires in this case, a halfwave antenna would be over 1.6 km
long. Since there's a length limit of 15 meters in the rules, you're going
to have to use a heavily loaded antenna to reach resonance, capacitance top
hats are a big plus. To hold down losses, the antenna has to be very high Q.
The Q will be so high that the AM sidebands will be off resonance. This does
bad things to frequency response. Limiting the modulation sidebands to a
few Hertz will work better. That implies CW or data modulation rather than
voice.

To achieve sufficient Q, you need to do things like use all silver plated
materials, silver plated Litz wire is best, and use basketweave style
coils to reduce parasitic capacitance. The ground system is critical,
a water pipe isn't nearly good enough. A broadcast style 200 radial
system isn't even good enough unless it's augmented by copper screening
laid around the base of the antenna. Every joint needs to be welded
rather than soldered. The resistance of a soldered joint will introduce
too much loss.

(This may be an application for the mythic crossed field antenna design.)

> If I seem a little weird its because I am an expert on computers but I can't
>build a radio. (I can build a computer though). I
>would like to see how your project turns out. One more question though, is it
>IMPOSSIBLE to make an effective LF HT?

Yes, if you want any reasonable range. A range of a few hundred feet is
possible with a reasonable HT, but to reach out hundreds of miles you
need an antenna system similar to the one described above. Routine data
transmission over 1,000 mile paths is possible, but the data rate needs
to be very low, and coherent detection techniques need to be used. The
signal will be totally inaudible to the human ear over such distances
due to atmospheric and manmade noise.

>anyone's comments:
>
>Grounding Rod: Punched in before basement cement is poured.
>Should it be isolated from the basement floor?
>(soil is sand, high water table (South west shorline michigan)

You want to install a *Ufer* ground. A Ufer ground consists of rebar *in* the concrete. Make sure all the rebar is properly electrically bonded together before they pour the floor, and bring a termination out for the shack. You may want to sink some regular ground rods in the mesh below floor level as well before the concrete is poured. Connect them with minimum #8 solid wire back over to the shack termination point. That will become your single point ground for all of your equipment. (Concrete is a better conductor than dirt, take advantage of it. The concrete will *not* explode under lightning currents if there is sufficient rebar in it to spread the currents. If in doubt, consult a good text on Ufer grounding.)

Now is also a good time to get the tower base poured. It should be Ufer grounded as well, and in addition have a ground ring and ground rods installed at this time. Run a low inductance strap back from this to your single point in the shack. You may also want to do a protective loop around the perimeter of the house. This is just a #8 wire buried around the outside of the footings and connected *at one point* back to the shack single point connection. Don't make any other connections to this loop. (Obviously, tie any water piping, power, telco, and cable TV grounds back to your single point connection as well. *NEVER DAISY CHAIN GROUNDS* Everything must tie together only at the single point connection.)

>Antennas in roof:
>Can you lay a antenna on the roof, before laying down shingles, or
>underlayment, or whatever? Would you have to limit your RF output?
>I'll have vaulted ceilings, so there's no real attic.

Antennas work better when high and in the clear. You can lay an antenna in wooden construction, but be careful about power levels. Not only will the structure absorb some power, but the EM fields *in* the house will become quite high. This may be a significant

bio-hazard. And it'll certainly be a potential source of EMI for other electrical and electronic equipment in the house.

>Cable runs: As the walls go up, what cable runs should I make up
>them? The shack will be in the basement, and I'd like to run
>a nice piece of coax up, with a remote antenna switch.

Run a 4 inch plastic or metal conduit up through the house for cable runs. Fit the conduit with a high quality pull rope so you can add cables at a later time. Also run an underground conduit out to the tower base. Make sure it slopes into a "dry well" at one end, and use 180 degree elbows at each end. The pull ropes should be *twice* the length of the conduit runs, and should be securely anchored at each end.

Now is also the time to get the proper power feed to the shack. Install a subpanel off the main house panel, a 100 amp panel would be good. 100 amp panels are about as cheap as smaller panels so you might as well use one. Equip it with a prominent and well marked master disconnect switch. Install *lots* of outlets. You can never have enough. Install outlets at the normal floor level *and* at bench height.

Now is also the time to install CATV and Ethernet cabling all over the house. Alarm wiring goes in now too. Run several extra twisted pairs into each room. These can be used for "smart house" connections in the future.

Um, er, I meant KHz everywhere I wrote MHz. Also, after looking at the
article again, I see that the medfer band is from 510 not clear up to
1750, but only to 1710 or maybe 1705. By the way, I ordered two kits
from the author of the article, and have not heard from him for awhile.
I suppose he is still scrounging the parts or something.

It sort of surprised me that the little Lowfer rig in QST (April? '94)
didn't have the rf portion out at the antenna. This seems like the most
basic expedient for legal success on this band.

1873. Two-meter satellite CW transmiter

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-21 18:13:26 UTC
From: os2user@vmdoug.utsd.att.com
Message-ID: <1994Jul21.181326.24439@devildog.att.com>
Source record: 117166

I'm looking for a simple two-meter CW transmitter for use on RS-10. I
can't use a crystal controlled transmitter because the protocol on RS-10
requires that the two-meter uplink signal be changed slowly during
the QSO so as to maintain a constant downlink frequency.

Does anyone know of any plans, kits, schematics, or outright rigs-for-sale
with a non-crystal controlled two meter CW transmitter?

Doug KA2UPW
doug@acpy01.utsd.att.com

Above opinions are my own and not necessarily those of AT&T.

1874. Re: LF Band experience?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-21 18:59:12 UTC
From: ka7oei@uugate.wa7slg.ampr.ORG
Message-ID: <94712@uugate.wa7slg.ampr.org>
Source record: 117163

Several years ago I did some LF-band experience.

The quickest and dirtiest antenna is probably a vertical.

Actually, I used a flat-top "T" type antenna strug between two trees
(but insulated from the trees!!!) tied into an almost-decent ground
(a galvanized steel irrigation system in the yard, as well as a chain-link
fence, not to mention a ground rod.

This first antenna system was rather poor (by LowFER standards) but it worked.
It was tuned to the transmitter (a bipolar design, at the time... Ugh!)
by having a Horizontal Oscillator Coil (from a TV) in series. The series
antenna current is then peaked (by adjusting the slug.)

This tuning network is pretty miserable (low Q, high distributed capacitance,
fairly high resistance, etc.) but it was easily audible (even under part 15
rules!) for several miles radius. Keep in mind that RFI is terrible down
there (most RFI filters don't start working until you get above 100 KHz!)
from almost anything - especially light dimmers!

If you can't easily hear the background noise on your receiver (be it QRM
or QRN) then you need to improve it by either better-matching your antenna
to your receiver (those TV coils work well here since you *can* tolerate loss,
plus the selectivity will keep AM-BCB RFI to a minimum...)

DO NOT put a preamp inline unless your antenna is really short (< 20 feet or
so) and is something like an "E-field" whip or an "H-Field" loop where
the impinging signal produces a very low terminal voltage at the antenna.

For a while, I ran a LowFER beacon ("CT" on 177.75000 KHz) that ran
CCW (10 baud) as well as 10 baud BPSK (and 1 baud BPSK, for a while...)
and it was regularly copied in California and Wyoming (from the Salt
Lake City, Area...)

I also experimented with SSB (using my Drake TR-7 as the exciter. Yes,
the TR-7 *WILL* generate a useable signal down to about 30 KHz from the
LF port if you have the AUX-diode matrix configured properly, as well
a simple outboard box...) on 177.750 KHz. It was an endless-loop tape
(60 seconds) with a clip of music and a voice and CW ID. This was
easily copied in Orem (60-70 miles south, over 2 mountain ranges...)

Hey, you can do that down there. Its a Part 15 service! Since GWEN
has been cancelled, perhaps the band will "clear" again... eventually:-)

```
I just built a house and put conduits in the walls, tubes thru the
(poured) concrete basement walls.
An additional thing I'd do is:
a run of #4 or larger copper wire or 1/2 inch copper pipe entirely
around the house with a ground rod at the electrical service entrance
and another ground rod at the closest point to the antenna entrance
with heavy pigtail up from that rod to the shack.
I agree about the two circuits into the ham shack. I've got 3 circuits,
two 120v and a 240v. If you have lots of lightning, you might want
an easy disconnect for the shack circuits. Not breakers, but large-gap
switches. This so you can disconnect everything when storms approach.

It does have to be accurate though in the sense that it reads 0 when the line is terminated in 50ohms. I've built several based on strip lines etched onto PC board (that was 20yrs ago) using designs similar to those found in the RSGB manual. As long as the impedance on the strip lines is correct then the board is precalibrated. I never got the trasnformer type (wound on toroid) to work.

BTW I buy the Daiwa ones now, they have those neat twin needles.

: presented with xyz stimuli, then required to do abc in response." It is so much
: less natural for a scientist, but so much more engaging, to write, "In this
: study, the children saw xyz, and responded with abc."

Yes, and the complexity of electronics makes it that much harder. Actually,
it isn't so much the fact that it is complex, but the fact that some people
do in fact have an amazingly deep grasp of their province of it.
Thus, the challenge is accurately conveying that expertise, without
misleading people. For instance, Dr. Rhode recently remarked upon the
clipping diode used in an FET oscillator which resulted in a whole bunch of
erroneous conclusions by the amateur community. I can say that I have no
intention of attempting to improve the phase noise of an oscillator
circuit is probably superior to that found in most transceivers today.

: I guess it's true that a good editor could convert the one to the other, but I
: can tell you for sure, mine doesn't have time to do so. We talk from time to
: time about rhetorical strategies, but getting it right is on my nose, not his.

Nor do some authors appreciate the attempts at a conversion. I know of
at least one well published author who says he carefully crafts every
word, and doesn't want changes. Not surprisingly, most of his articles
were published in a magazine that did little editing.

Interestingly, I'd say the introduction of the computer into the hamshack has
apparently had little effect on the amount of articles being written for
amateur magazines. It has enabled a few authors to write rather lengthy
articles :-).

The May 1993 QST has a pair of designs to generate a 144 MHz signal for
Ricks phasing transmitter and receiver. You have your choice of a VXO
or a more traditional LC oscillator/mixer/crystal oscillator. For CW,
a MAV-11 MMIC will drive a hybrid module such as the M57713 to 10 watts
output. If you want SSB, I recommend a driver for the module with less
distortion, such as the MRF 581 design in March 1994 QEX.

And, if you ever want to run a really big 2 meter signal, I suggest you
skip the hybrid module and look into something like a MRF 137 FET running
off 28 volts with lots of bias current. Properly done, this can drive
a high gain tube amplifier quite cleanly. Your neighbors will really
appreciate the clean signal.

Yes you *can* use a crystal controlled transmitter. All you have to
do is convert the XO to a VXO by addition of a variable capacitor.
You can easily pull the crystal enough to compensate for doppler.

Gary

Jon, finger stock is, well, RF gasketing material. It's made of phosphor bronze, or other highly conductive, "springy", metal, and is usually attached to RF enclosures along edges that need to open for service access. It consists of parallel "fingers" of metal, laid out comb-like. The back of the comb is rivited or screwed to one chassis part. The fingers rest upon the the other. This effectivly closes any gaps in the shielding for RF. Sometimes the fingers extend almost straight out from the back. Other times they're bent around in a D shape.

I've never seen it in stores. I've seen it in Surplus Sales of Nebraska's catalog. They advertise in QST. A scrapyard may also be a source, or a hamfest.

|> (soil is sand, high water table (South west shorline michigan)

Well, you really should only have *one* ground rod for the whole
house and NEC already requires it. You might, however, make sure it
is properly installed (mine was laying at a shallow angle), is a good, solid
copper one. You might, however, want to run some beefy wire (#6) from it
to your shack.

|>
|> Antennas in roof:
|> Can you lay a antenna on the roof, before laying down shingles, or
|> underlayment, or whatever? Would you have to limit your RF output?
|> I'll have vaulted ceilings, so there's no real attic.

It'd be lossy but, yes, you could. Do you have covenants to
worry about? You might want to beef up a section or two so that you
could easily add a roof mount tower or other antenna securing stuff.

|>
|> Cable runs: As the walls go up, what cable runs should I make up
|> them? The shack will be in the basement, and I'd like to run
|> a nice piece of coax up, with a remote antenna switch.

I'd suggest running 2.5" pvc as a cable run from your shack
to whatever "attic" you have and from there to the roof. For the bottom
end I ran my PVC into a regular double electrical box. That way you can
use std covers & fixtures. When you move just put a blank over it.

You may also want to run some cable from your office to your shack.

I'd also suggest running two phone lines into each room.

regards, Mike

Yes, and since it is best to use different rx and tx antennas, and the
rx antenna can be of any size or shape, it would just be the final rf
output stage out there, it seems, unless there is some problem in running
the coupling over long leads. In fact, Conner in the "Scrapbook" cited
in the article, describes some such arrangements, with the rf final
stage built right into the antenna structure. That "Scrapbook", by
the way, is a real delight. ------ Phil Emerson, aa8jo.

Something I wish I had along these lines... is an individual run of
telco and CATV from each room to a central point (your wiring closet).
This allows you to put gadgets (home PBX, video switcher, bla, bla) in
this closet and send different things to different rooms. It's a pain
(or impossible) doing this when the telco is daisy chained from jack to
jack or the CATV has splitters hidden in the walls or the attic.

1894. HELP-getting sticky velcro tape to stick?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-22 20:12:37 UTC
From: markeh@netcom.com
Message-ID: <markeh-220794121237@markeh.slip.netcom.com>
Source record: 117076
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.equipment

Maybe someone here has some help for my problem. I have a mobile in my car, mounted in the trunk, with the control head stuck to the dash with sticky velcro tape. Well... not very sticky, since it keeps falling off.

I seem to have partially fixed the radio side of the problem, by using strips of tape long enough to extend around the end of the control head and wrap around the ends. But I havn't been able to solve the dash side of the problem - the tape unsticks, and falls off after a few days.

For several reasons, drilling holes is a poor solution, hence the velcro tape.

Any suggestions???

Help much appreciated,

73 Mark KM6FM

1895. Reply to FFT Question

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-22 20:36:02 UTC
From: mack@mails.imed.COM
Message-ID: <9406227749.AA774912962@mails.imed.com>
Source record: 117078

Here is a reply to the FFT question. I have taken many liberties here to simplify what REALLY happens. I have always considered Fourier transforms to be magic too!

Put simply an FFT is a numerical way of doing a Fourier transform(i.e. on acomputer). It sounds like you might also want to know how a Fourier transform is done. Any Fourier transform is a convolution of the sampling function and the data to be converted. For a continuous Fourier transform this invloves the multiplication and integration of a unit impulse and the data from -infinity to +infinity. A FFT is a numerical approximation of the integration process from -pi to +pi radians. Part of the magic is that the function used to do the convolution is a complex function whose value is sin(x)+jcos(x) (or some such. Look it up in a book). j is the EE way of saying imaginary (complex numbers).

This can be done in basic, because I have done it, but it isn't pretty. The problem comes from having to do complex arithmetic in a language that wasn't designed to do it. The other problem is that the shear number of multiplications and additions can cause a BASIC interpreter to run out of range in the numbers produced. A lot of BASIC's use 32 bit numbers for their floating point. There are books in most university libraries that will give you the algorithm for doing a FFT. I have found only one or 2 that make the algorithm understandable, though. The output of the FFT is TWO arrays of values! One is the real array of values and the other is the imaginary values. Usually, a program will convert the real and imaginary into magnitude and phase arrays (remember rectangular to polar conversions?) which are of more use to most engineering types.

I do this kind of stuff for a living and it still makes my brain hurt thinking of it.

The diagram you saw in the textbook illustrates something called a butterfly function, which takes advantage of the symmetry and duplication involved in doing a DFT when the number of samples is a power of 2.

I believe that there was an article or 2 in BYTE back in the early 80's on doing a FFT in basic. You could find those articles and use them as a guide, but beware that one of the articles has a program with bugs in it!.

> the samples have been magically replaced... How does it do that?

This is the definition of what a Fourier transform does. You can plot a periodic waveform as amplitude vs. time (-infinity to +infinity), or you can plot the component frequencies AND phases for all frequencies from -infinity to +infinity. BOTH representations describe the same physical phenomenon and they are exactly equivalent to each other.

An interesting example:

If you have studied any radio or electronics you may have heard that a square wave is composed of all of the odd harmonics of the fundamental frequency. This is only half of the picture. A square wave is:
sin(x)+ 1/3 sin(3x) + 1/5 sin(5x) + 1/7sin(7x) .....

If you instead combine:

sin(x) + 1/3 cos(3x) + 1/5 sin(5x) + 1/7 cos(7x) ......

you get an entirely different waveform with positive and negative spikes instead of a square wave. The FFT MAGNITUDE plot of the two waveforms is IDENTICAL, but the phase plots are different!

Consider running extra twisted pairs in those TELCO lines, and run some
75 as well as 52 ohm coax. I also run a dedicated 20 amp circuit to each
location that I plan to place a computer or stereo gear. It assures cleaner
power. Run an "ordinary" outlet to the same area for lights and stuff. Keeps
the junk outta your computers.

BTW, the biggest pain in the butt was running 500 ft of thin ethernet, without
cutting it, through the entire house, looped through all the boxes.

Also run flex plastic conduit and boxes to your planned stereo speaker
locations in the family room. Your SO will like the lack of cables dangling all
over the place.

For sure pick out and use a wiring closet, and be sure to have a clear path to
the attic and basement and all other floors. Much easier to run new stuff. Daisy
chains for TELCO and TV also have so much line loss that you cannot get
good TV or phone lines.

Course, I hate sorting out all the wires when the house is finished. Markers always
seem to evaporate when I come in to hook stuff up. <sigh>

YMMV

>doug@acpy01.utsd.att.com

>Above opinions are my own and not necessarily those of AT&T.

There are plenty of rigs around for sale.
For example, I would like to sell my Icom 202S (SSB/CW no FM) VXO
controlled rig. It puts out a couple of watts, and the VXO does a decent
job of covering the band 200 khz at a time.
But it seems I want way too much money for it, and since I don't _need_ to
sell it, it will likely remain here for quite some time.
All mode rigs show up at all the hamfests around here.
That is how I got the 202S and my Icom 251A a few years ago.
A 251A might cost $400 or so now, with the recent changes in the relative
value of the Yen and Dollar.

This is just a thanks to all those who responded to my query i.e. the article 'Who was that masked capacitor?'. The numerous responses I got gave me a colourful range of descriptions for the piston trimmer, as well as suggestions on where to get one (I even had one person offer to hunt in his batch of parts for one). This response just reinforced the theory I had that the ham community is a closely-knit group of very helpful individuals (which makes me glad I've only got a few weeks before I've got my licence).

Incidentally, I apologize for not posting this thank-you sooner, but when you're juggling a few things, sometimes one thing will get a little lost in the shuffle and keeping up with my mail/news was one of them.

Live long and propagate

What you do is what the manufacturers do, you put the relay on a network analyzer, measure it's reactances, and absorb them into your circuit design. Most open frame relays can be made to work.

Note: the reactances will often differ considerably between the open and closed state of the relay. You can use this to your advantage with the proper circuit topology.

I have two coax relays that I am no longer using. Both are milled out
of solid metal and silver plated. As I remember, one is a 2-pole switch
and the other is a 6-pole switch. I'll check for exact specs if you're
interested. Connectors a BNC; does this imply VHF or lower frequency?

They're top-notch military surplus that I'll sell you for a cheap price.

I would like to build the Poor Man's Packet modem, but I can't seem to find the August 1991 issue of 73 Magazine. Could someone either send me the schematic in PCX, ASCII, GIF, BMP, or some other computer readable form, or perhaps mail me a photocopy of the article? Thanks.

I am in need of parts for a dead Alinco ALX-2T Handie Talkie. If any one has antoher dead or damaged unit out there I wuold like to buy it. Rig receives good but would like to get it on the air for a young ham to start on and Alinco does not have parts anymore for the old HT. The whole thing is surface mount inside and all I need is a few of the chips to get it going.

Steve,

You can charged the RS hi-capcity batteries in a normal charge but it will
take a bit longer. Radio Shack sells the hi-capacity charger for the batteries
and that is what I use.

The best charger for charging NiCads is a peak charger (using -dV/dT method). Maxxim
sells a chip that will do the job. Check your DigiKey catalog for that part.

Good Luck!

Frankly, I'm not impressed with my ability to build a VFO up at those
frequencies; it can probably be done with reasonable stability, but not
with my mechanical abilities.

How much of a change in frequency is the doppler going to produce? You
can actually get a rather substantial frequency change with a VCXO.... just
a padder cap that lets you change the loading on a crystal oscillator. It's
not going to tune the whole band, but it should be enough to compensate
for doppler, and it's stable and dirt cheap to build (assuming you can
get the crystals cheaply).

: that may have been published?
: Frequency range of interest = 1 to 1000 MHz.

If you're not interested in the phase response it will be pretty
easy for an experienced ham to roll his own scalar
network analyzer. The reason HP charges $30K for
an instrument like you describe is the difficulty
in measuring phase with an accuracy of 1 degree or so.
Another difficulty is measuring the return loss (a
measure of VSWR). Again, if this isn't important it'll
be all the easier. You're best bet for information is
to scrounge a service manual for an HP 8505, 8753, or
8510. They will have schematics that will give you the basic
idea. This is assuming you've no interest in selling
your finished product since that would/should be illegal.

I should think that a 4400-watt circuit would suffice for a kilowatt amplifier! Of course, if you're thinking resale, there's the possibility of your shack being turned into a woodworking shop, but I think 20A at 220V would suffice for that, too.

What you might want is several separate circuits, to allow a greater degree of isolation between pieces of equipment. Two 220V and two or three 120V, perhaps.

I agree with Gary Koffman, you can pull a xtal controlled rig to work satellite. I would suggest you look for an AMECO TX-62 transmitter. They go for between $20 and $40 at hamfests. Some have a VFO with them. They put out about 30 watts which should be plenty to get into RS-10/11.

Good luck.

: >relays as opposed to coaxial realys.

: What you do is what the manufacturers do, you put the relay on a
: network analyzer, measure it's reactances, and absorb them into your
: circuit design. Most open frame relays can be made to work.

It is my experience that many manufacturers get by without exotic
equipment like network analyzers (those who sell to the competitive
amateur market).

I suspect that many merely add the relays to existing amps/preamps
and retune the matching circuits by hand, optimizing the preamp with
a NF meter and tweaking the power amp with a wattmeter. I'd love to
hear from manufacturers who actually do it differently. Incidentally,
it ought to be possible to build a pretty decent NF meter using the
noise source we published in QST, a precision attenuator to bring the
excess noise ratio down to 5 dB, and a AM receiver/DSP/computer setup.
(something I'd work on if I didn't have other neat ideas to work on...)

True, one of the better ways to design circuits is to completely
characterize the parts and then use expensive (new car priced)
computer models, but getting accurate VHF measurements on devices
like GaAs FETs is difficult. Anyone know what the noise parameters
on a MGF1801 are at 2 meters? And, even if you do get them, the
impedance is probably high enough that modeling is difficult--the
little stray reactances will skew the model.
: Note: the reactances will often differ considerably between the open
: and closed state of the relay. You can use this to your advantage
: with the proper circuit topology.

I personally like to run wire thats 2-3 times more than you'll ever need. Wire is cheap, and so are circuit breakers. Having to re-pull if you decide you need more power is time consuming, and expensive once the walls are up.

I added outlets in my basement, and never use anything less than 12 gauge. The circuits are all rated for 20 amps, and that's primarily because I'm using standard service outlets. I also limit it to 3-4 outlets per 20 amp circuit.

Of course, some people say that if my house ever shifts on the foundation, I can straighten it up by torqueing the extra wiring I've added.

Problem is that the drywall guy, the electricians, and the bricker all abuse the ends of the wires. I had better luck this time using color-coding tape.

I have also used some self-laminating markers that can be written on, then wrap around themselves to seal in the info.

Usually I just ring them out with a cheap RS digital ohmmeter with a continuity beeper in the basement, and a kid with a cheap walkie-talkie at the other end.

Whatever works!

: Always put clear heatshrink over the wire numbers. That'll make them
: stay on.

Good idea, though labor-intensive. A couple alternatives to consider: wire markers with built-in protection (I have a roll of this stuff: white area for marking with a clear leader that covers the marking when wrapped around the wire), and simply writing directly on the wire with something like a "sharpie" magic marker. In gray or white pvc insulation, this becomes nearly indestructible, save cutting off the end of the wire. Of course, it doesn't work very well on Teflon insulated wire or for black-jacketed wire.

Does anyone make pre-numbered clear (since the numbers are going to be inside where they won't abrade off) heat-shrink sleeves? That would be very nice, requiring only a heat source to apply.

If it is truly only 24 pgs, there is barely an excuse NOT to have it in QST. A typical QST is circa 240 pgs long. What is an extra 24 pgs? The existance of QEX can't be explained by the vast amount of material that won't fit into QST. The only possible excuse would be to get an additional subscription fee. If anything, the ARRL should be encouraging experimentation, not discouraging it. Well, c'est la vie.

The other day I bought a "make you own radio set" for my 7 year old son.

This was a germanium crystal 'wind your own coil' type thing - unfortunately I couldn't get it to work. Much dissapointment - I promised to 'ask the net!'

Soon after this I saw in an exibition some 'home made' receivers built by prisoners of war in a world war 2 prisoner of war camp - these were made from old wine bottles, tin cans scraps of wire etc.

Now my question. How can I make a very simple radio (which works) from every day materials - are there any books papers etc. with tips on how to get these things going?

Can I improve on any of the 'trickey' parts the origonal designs with modern components?

Joe

I use some heavy duty velcro from Radio Shack. It is made of plastic. I
actually have it holding up my TM732A mobile which is stuck to the metal wall
behind the seat on my pickup. This stuff is really strong. I also use it to
hold the control head to the dash. I trimmed off some of the "hooks" because
the stuff is so strong it is hard to separate the two pieces.

1930. What is this HP Thinkjet IC ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-26 14:14:41 UTC
From: charlos@rivm.nl
Message-ID: <CtJwwI.Muv@rivm.nl>
Source record: 116968

hello all,

I have built the loop antenna described in QST of May 94,
(works fine btw, tunes from 14-24 Mhz)
and want to add a stepper motor drive to tune the antenna.
I have found an old HP Thinkjet printer that has just the
stepper motor I need: it has a step size of 7.5 degrees
and combined with a small 1:6 gearbox I have it should do
allright.
The stepper motor (used in the printer for paper-feed)
is apparently controlled by an IC marked: 1858-0097-8610 .
My question is: what is this IC ?. Is it a HP part number ?.
Can anyone tell me what it is and what I can use to replace
it with ?

thanks and 73,

Seems to me that they started it a little while after they started
selling lifetime subscriptions to QST. Always thought is was just a
scheme to for "revenue enhancement" to sell lifetime QST subscriptions
and then move the (advanced, technical) content of QST to QEX and keep
the _beginners'_ material in QST. Slick.

What about using diodes? How big should a diode be to switch (hold back) 100W on 2m? (How do you keep 100W of RF out of your GaAs FET Preamp?).
Just wondering,

Message-ID: <CtK3HL.D06@pts.mot.com>
Source record: 116980
Cross-posted to: sci.electronics,rec.radio.amateur.homebrew

I've got a Mixer question. I'm working on a single bipolar transistor mixer, downconverting from 900 MHz to 21.4 MHz. High side injection. I've got a 2-pole ceramic block filter on the input, so the image noise contribution is taken care of. Now, the question. I have noticed that the indicated noise figure (Using a HP 8970 Noise fig Meter) vary's by about 4 to 5 dB depending on the generator that I am using for the LO injection. the HP 8657 is the worst, followed by an 8644 at about 2 dB better, with an old cavity tuned 8640 the best, at 4 to 5 dB better than the 8657. My initial take on this is that this is due to the variation in Phase noise between the generators, but I'm not positive. MDS Simulations correllate with the results from the 8640, and I tend to think that those are the correct numbers (Besides, they are the best!) Is this due to the phase noise performance of the generators, or is there something else happening here?

: I wouldn't want to make a habit of using it that way without having
: a look at the resulting spectrum first though.

I've had a fair amount of experience in designing linear amplifiers on most of the amateur bands through 10 GHz, including 432.

Glenn's suggestion may work. However, even this type of bias might be enough to cause the most serious problem--thermal runaway. What happens is the amp starts to draw more and more current, till the transistors blow up. The possible difficulty is that amplifiers tend to be pretty inefficient at low power outputs--it might be generating more heat at 10 percent of output than at 100 % of output because at full output the finals are acting as low loss switches, as opposed to lossy resistors.

Another big problem is stability. Some cheap class C amplifiers only put out a clean signal when injection locked to the input signal--the only time they are clean is when a big enough signal is present to overcome the inherant instability of the amplifier. Sometimes, installing just the right lossy resistors in the right spots will help. Stabilizing such amps can be real black magic.

Finally, the amount of intermodulation distortion can be fairly large. In other words, people might complain about how wide your signal is. As a rough rule of thumb, when you start to drive an amplifier past half the saturated output, your signal starts to get wide. Thus, a 20 watt "linear" amplifier may work great up to 10 watts, pretty good up to 15 watts, and splatter across the band at 20 watts.

1935. Cold-switch relay voltage ratings

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-26 18:29:31 UTC
From: btoback@netcom.com
Message-ID: <btobackCtK8p8.3L1@netcom.com>
Source record: 116971

The voltage and current ratings of relays are normally given with the assumption that the relay will be called upon to switch a circuit at that voltage while the rated current is flowing. Obviously, if a relay is switched "cold" it can handle higher voltages and currents.

Can someone give me an idea of how to calculate the maximum voltage rating of a relay that is cold-switched? It should be a function of the contact separation distance, assuming that the rest of the insulation on the relay is adequate to handle the voltage. I'm looking for a way to electronically bandswitch a high-power amplifier, and I'd rather not spend lots of money on vacuum relays if I can avoid it. Are mercury-displacement relays good for this kind of service? (How do you calculate the inductance of a pool of mercury, anyway?!)

Another related question: Does anyone have ideas for a safety interlock that would discharge the HV power supply capacitor faster than the bleeder alone (without causing an explosion!)? The time constant for a 35 uF capacitor and a 200K bleeder resistor is such that lethal voltages remain in the HV circuit for about 30 seconds after power is removed. I'd like to shorten this to a second or two if possible.

Thanks,
-- Bruce Toback

It _is_ an HP number, but may cross-reference to something more common. The only useful thing I can guess from that number is that it's a transistor array or darlington driver, or something like that. The 1858 numbers all seem to be, anyway.

The 8610 is a date code.

> much wire.

Yup. Need the 12ga wire to reduce voltage drop, and an isolated ground to reduce noise. Circuit is dedicated to one PC type computer only, about 10 amp draw absolute max. I have found the "negative resistance" characteristics and pulse noise from PC power supplies needs a dedicated circuit for reliability. The 12ga wire helps avoid voltage drops, and the dedicated circuit eliminates noise from other equipment. The "negative resistance" thing refers to the switching power supply tendency to draw a lot more current as voltage drops in a brownout. Heavy wire helps reduce voltage drop, and thus excessive current draw. The UPS handles the rest of the problem <grin>!

>
> Another thing to remember from the NEC is that YOU MUST NOT run RF

Good point, both from legality and noise problems. Nothing is in conduit in the house---

>
> You should also check local codes against the suggestions for
> grounding where it applies to the power entry. The power company only

Interesting enough, the grounding here has to be a driven ground rod in moist soil. None of that silliness of using a single piece of re-bar in the house slab!

>

Even better, I have two independent circuits. One is the usual AC powered one, with the smoke detectors inter-connected, and placed where every bedroom can hear one/be covered. The other is a separate, battery-backed up UL listed alarm system with a set of smoke detectors on a special loop. Most electrical fires will take out the AC powered ones first. The alarm panel will wake us if the power does go off anyway

Should see the MASS of wire in the wiring closet--

There is an excellent book called "Digital Signal Processing in Basic" --
the name of the author escapes me at the moment -- that answers all these
questions and more. It discusses the mathematics as well as providing
algorithms in Basic. If you, like me, find it easier to understand a
mathematical algorithm when you see both the math and the algorithm at
once, this is the book for you. It's about 200 pages, soft cover. I got
mine at Computer Literacy in San Jose. I may have the book at home; if
so, I'll post the rest of the details tomorrow.

If it is truly a LINEAR amp, it will work find on SSB.
If it was for 440 FM it is probably not linear.

Message-ID: <9406267752.AA775262763@mails.imed.com>
Source record: 116974

In regards to prewiring a house:

You gentlemen have missed one thing in deciding what wire to run. A 20 amp circuit is only rated to supply 15 amps in continuous duty. Just a little tidbit from the National Electrical Code (NEC (also a big Japanese company)). If you REALLY want 20 Amps you should run #10 wire. If the run is especially long, you will want slightly larger wire to lessen the voltage sag, but you probably aren't running that much wire.

Another thing to remember from the NEC is that YOU MUST NOT run RF cables, ethernet, phone, etc. in the same conduit as the electrical power!

You should also check local codes against the suggestions for grounding where it applies to the power entry. The power company only has jurisdiction with the power part of the grounding though!.

I second all the suggestions about adding PLENTY of circuits and other wiring. The suggestions about conduit out to the tower location are also very good.

I HAVE seen clear heat shrink with markers but I don't remember where. I suggest trying Grainger or other electrical supply places. This is not a new problem, so there are probably ready made solutions out there.

While you are adding lots of extra money to this house, you might also consider having fire sprinklers installed. Check with your insurance company to see if they give a substantial discount for having the house "fire-proofed". It may or may not be cost effective. I have friends whose houses have burnt down or been heavily damaged. Their experiences in the aftermath were very unpleasant. Just something to consider.

While on the fire subject, don't forget to put smoke detectors EVERYWHERE. If you have small children, put one INSIDE each child's room. If (heaven forbid) they should decide to play with fire, they will most certainly close the door to do it. Having a smoke alarm inside the room gives you that much more warning (and peace of mind).

From: drew@trl.oz.au
Message-ID: <drew.149.0@trl.oz.au>
Source record: 116985

A few weeks ago there was some discussion about "why so many impedances for coax cable". It was an interesting thread. And somebody gave a pretty good explanation of why 50 ohms became a common "standard" and attributed it to (I think) the US Navy- which may have caused all the other users to fall into line.

I would like to know more about this subject. If we look at radio text books pre WW 2, coax hardly gets a mention, 600 ohm open-wire was all the go. After WW 2 the books are full of coax. Was it simply the impetus of war which pushed the use of coax? Or were there other factors?

Did this way back when (when men walked on the Moon). If memory serves, measure the height of the stack of e laminations. And measure the width of the center leg of one of the e's. Along the axis parallel to the way the adjacent I's run. use these 2 numbers to calculate an area, the area of the center core. Number of primary turns (for 120V 60Hz) P(turns) = 800/(center core area). this assumes you used inches to measure. then do a ratio to get the needed turns for your secondary(s).

If old windings exist, you could count as you remove them, and get the turns per volt ratio. If the primary is in good shape, you could just re-do the secondary.

1948. Cyprus (IC Designs) PLL chip, no external analog stuff, programmable

Newsgroup: rec.radio.amateur.homebrew

From: wa2ise@netcom.com
Message-ID: <wa2iseCtL8qI.7o9@netcom.com>
Source record: 116987

At work, getting started on a circuit and system design that requires
a PLL oscillator. Found what looks like a really good chip, made
by Cyperus (or a subsidery "IC Designs"). The only external stuff you
need is a crystal (like 1 to 20MHz or so) or external clock, and a
source of serial bit stream to program the chip every power-up (loading
registers). All that yucky analog stuff is inside the chip, so you
don't have to mess with loop filters (poles, zeros and all that).
The output can cover the HF to low VHF frequencies. And it costs
something like $2.60 (forgot if that's large quantities or not, usually
oneies-twosies is at most 2-3x that). Looks like I could make a QRP
rig that I could get many channels from (frequencies are in small steps).
Or a small 6M beacon.

Got some samples, going to see how it really works. If it's a simple
digital design, I might post how to do it. In a few weeks.
xxx 2061 was part number, forgot the prefix.

About 20 years ago, you used to be able to go down to the local friendly power company, and the would give you some used transformer oil. Which turned out to be PCBs (yea, the stuff that causes cancer). Maybe some dioxen in there too. Those Heathkit cantennas didn't seal real well, and the oil would leak out some, and get on your hands sometimes. I used to say "ick", and wipe my hand on my shirt. I suppose I recieved more than my minimum adult daily requirement for PCB's and Dioxen.

: think that those are the correct numbers (Besides, they are the best!) Is this
: due to the phase noise performance of the generators, or is there something
: else happening here?

Since you are using a single bipolar transistor mixer, AM noise on the
LO signal offset +-21.4 Mhz from the carrier can mix down to your IF.
The variations you see are due to differences in the noise of the
generators, although at 21.4 Mhz offset, I wouldn't call it phase noise;
the AM component of the noise is responsible.

To improve your performance, you could filter the LO, limit the LO (which
would strip off the AM noise), or switch to a single or double balanced
mixer topology.

Zack Lau (KH6CP) (zlau@arrl.org) wrote:

: Yes, and the complexity of electronics makes it that much harder. Actually,
: it isn't so much the fact that it is complex, but the fact that some people
: do in fact have an amazingly deep grasp of their province of it.
: Thus, the challenge is accurately conveying that expertise, without
: misleading people.

I'm not sure it's really that much harder. Systems have become an awful lot bigger, beyond what anyone could imagine. The basic blocks of those systems are pretty much as digestible as ever. People take fright at the size of the system, and never realise that you don't have to understand it all at once. Most amateurs are happy enough with individual blocks like, say, a VCO, but never become comfortable with the concept of taking an overall view in the most general way of the operation of the synthesiser that the VCO is one part of. This is easy to do, the problem is one of overcoming aversion, so many people say " That's too complicated for me" that almost everybody has been fooled into beieving them.
It is sadly ironical that circuit "simplicity" is seen as parts count. I know of some cases where a redesign allowing more components can produce a circuit that is easier to get going. I get a cold shudder when I see some circuit described as "Simple" if I can see that it needs careful selection of parts to get it going, and someone at least as smart as the designer to be able to adjust it.

One challenge for an author covering one of the classic "Frightener" type subjects is to persuade the readers not to run away to another subject, to convince them that they not only can understand the material, but can also exploit it to their advantage. I've always found that university exam questions on filters and control theory are generally set easier than the rest. I guess the professors in those fields are just so glad to get someone selecting their question that they want to reward them !

: For instance, Dr. Rhode recently remarked upon the
: clipping diode used in an FET oscillator which resulted in a whole bunch of
: erroneous conclusions by the amateur community. I can say that I have no
: intention of attempting to improve the phase noise of an oscillator
: circuit is probably superior to that found in most transceivers today.

I got to read the Rohde's full manuscript because of my handbook involvement, but haven't read the published version, and haven't come across the conclusions referred to - has everyone gone berserk clipping diodes? or have diodes in oscillators become anathema?

Ulrich's analysis of simplistic oscillator level control should be an
eye-opener, everyone has taken something for granted for too long, but
remember that these sorts of design mistakes crop up in the VCOs of
synthesisers, and the phase noise disadvantage can still spoil things
there. Give me a quieter phase noise VCO, and I can play with the
trade-offs to exploit it to get a cleaner synthesiser.

: Nor do some authors appreciate the attempts at a conversion. I know of
: at least one well published author who says he carefully crafts every
: word, and doesn't want changes. Not surprisingly, most of his articles
: were published in a magazine that did little editing.

I know it's not me, but my ears were burning.... I wonder what the
handbook process will do to my English English prose and spelling ?

: Interestingly, I'd say the introduction of the computer into the hamshack has
: apparently had little effect on the amount of articles being written for
: amateur magazines. It has enabled a few authors to write rather lengthy
: articles :-).

So that's why my ears felt hot !

>Can anyone tell me what it is and what I can use to replace
>it with ?

You can call your local HP office to get the telephone number of
the European parts center -- I think it's in Boeblingen, Germany.
The parts center will be able to give you more information.

HP designs a lot of proprietary parts for their low-cost printers
in order to get the most use out of their mechanical parts. I'm not
sure about the paper feed stepper in the ThinkJet. If all else
fails, you could just leave the printer circuitry connected and
control your tuning capacitor with PCL. Heck, it'd be easy if you
get the gear ratios right: <esc>&a+5R to go up 5 KHz, <esc>&a-2R
to go down 2 KHz, etc. :-)

Conway Yee (yee@mipg.upenn.edu) wrote:
: >It's a short (24p about) publication by the ARRL, designed for
: >experimenters. It's the technical stuff that should be in QST
: >as far as I'm concerned, but the League has decided to cull out
: >those parts and publish them separately. It comes out every month.

: If it is truly only 24 pgs, there is barely an excuse NOT to have it
: in QST. A typical QST is circa 240 pgs long. What is an extra 24
: pgs? The existance of QEX can't be explained by the vast amount of
: material that won't fit into QST. The only possible excuse would be
: to get an additional subscription fee. If anything, the ARRL should
: be encouraging experimentation, not discouraging it. Well, c'est la
: vie.

Let's see... we create a magazine specifically to cater to the needs of the amateur experimenter, and that's viewed by some as discouraging experimentation. How strange. I guess we're also discouraging them by publishing the digital/VHF/Microwave conference proceedings, since those aren't in QST, either. Our publishing of National Contest Journal must be an attempt to discourage contesting, too.

In fact, QEX is 32 pages each month. If we thought it would be a good idea to put that material in QST--and we don't--we'd have to come up with about the same number of pages of additional QST advertising to pay for it. From where, I don't know. Might have to raise membership dues, too.

The reason why we put a particular article in QEX instead of QST has to do with the audience we think the material serves. What is the benefit of putting into a magazine that goes to 170,000 readers material that might interest only a fraction of a percent of them? That would be criminally wasteful. The advantage of running material in QEX is that it is targeted to the particular community that will find it of interest. And because the production costs of QEX are substantially lower than those of QST, we can afford to give more pages to an article, expanding with text and figures as needed. That's particularly important with technical articles.

The technical material we put in QST is designed to meet the needs and interests of a broad spectrum of readers, including weekend project builders. The articles in QEX, on the other hand, are intended particularly for people who are _developing_ circuits, procedures and algorithms. Those people are a small minority of the 170,000 who read QST.

At $12/year (for ARRL members in the US), I think QEX is a bargain.
(I'm prejudiced, of course--I edit QEX.) I don't expect QEX income will
ever exceed its expenses. We'd like QEX to break even, of course, but
we don't mind continuing to lose money on it (a moderate amount,
anyway) because it serves its intended purpose of providing a forum for
experimenters.

>>about and who publishes it?
>>
>It's a small (30-some pages), technical publication published monthly by
>the ARRL. $12 a year, if I remember correctly. Look in a QST for
>subscription info.

I don't know why the ARRL keeps QEX such a hidden secret. I have yet to find mention of it in the multi-page "publications" advertisments which the ARRL regularly places in QST.

I find it amazing to find "CQ Ghost Ship" prominantly listed and not QEX. Someone in the marketing department must have a warped sense of priority.

Call up the ARRL at 203-666-1541 (I've always found the "666" part humourous :-) to subscribe.

For ARRL members in the U.S., it is $12 for a year's worth of monthly issues. Cost $24 to non-members. The masthead names Cathy Stepina as being in charge of QEX Circulation.

For those in the great white north (eh?) and south of the border, it is $25 for members and $37 for non-members. Price goes up to $60 (urgh!) for non-ARRL members elsewhere.

No, there are no contest results, RACES rantings, gossips about school teachers, rumours of DXpeditions, or Hams-in-jail in the pages of QEX.

However, if you like building gear, it is worth a subscription. The articles are not written so that you can copy the designs, but more of the flavor of seeding you with new ideas.

The last couple of issues each had an article by Ulrich Rohde on oscillator phase noise and in the issue that just came out, he discussed the measurment of receiver intermod performance.

In this past year, articles have included DSP methods for doing Weaver ("third method") SSB generation, RX bridges, machine detection of CW buried in noise, nifty uses of MMICs,....

The editor is Jon Bloom, who regularly contributes to rec.radio.amateur. Perhaps he can arm twist the marketeers at the ARRL to start including

QEX among the other publications in the QST ads.

Perhaps Jon could also submit a table of contents each month to rec.radio.amateur.

Oh, yeah, if you like QEX, you'll love Communications Quarterly. Ads for that can be regularly found in the CQ Magazine.

>And radar was a WW II invention.
>

Microwave radar uses (and used) waveguide rather than coax, and WW II radar advanced pretty quickly from the first 10 meter systems to 10cm systems. The impetus was almost certainly the convenience of coax when you don't have time to get everything right for balanced line. You can bury it, run it through metal ducts, stomp on it, and generally mistreat it without seriously impairing its performance; balanced lines require much more care.

Radar, incidentally, was not a WW II invention. Microwave radar, which permitted much more accuracy in ranging and much higher target resolution, was the real "secret weapon" but lower-frequency systems had been in use since the 1930s. It's just that they were so limited in capability that nobody gave them much credence.

One problem may be your headphone. Most headphones used today are
low-impedance. You need a sensitive high-z set for a crystal radio.
These are available from :
Antique Electronic Supply
6221 S. Maple Ave.
Tempe, AZ 85283
Phone (602) 820-5411

The Headphones are expensive however a crystal earphone is much cheaper.
If you do use a crystal earphone put a 47Kohm or 100Kohm resistor across it
to provide a D.C. path for current. If you don't it may not work. Some of
these earphones had a resistor built in. But I don't think they come that
way now.
They also have crystal radio kits.

>war which pushed the use of coax? Or were there other factors?

I don't know - I'll just give some speculation...

There was certainly a lot of brainpower that went into antennas and
transmission lines in connection with the war. Both radar and VHF/UHF
radio became big technologies in the period. (contrast with the first
ham to operate on the then 56mc band; he had to remove the bakelite
bases from his tubes to reduce lead length and losses)

When was polyethylene developed? I remember having some WWII-vintage coax
that was insulated with some other compound, which seemed to have many
of the properties of chewing-gum. And I remember seeing some rubber-insulated
coax, which probably wasn't very appealing at RF either. So to get
flexible coax you need a good insulating material. In the days of open-wire
line we didn't have polyethylene twin-lead either.

A number of years ago I was at a science conference where one of the speakers
was a chemistry professor - Prof. Park of Colorado at the time and had
previously worked for DuPont. He told about inventing/discovering Teflon.
He was a lifelong worker with fluorocarbons. He had made some
tetrafluoroethylene gas and stored it in a steel gas cylinder. His boss
wasn't enthusiastic about that particular line of research, so they put
the gas cylinder aside and worked on some other things.

Later he had some occasion to want to do something with the gas again, so
he found the cylinder. When he opened the valve nothing came out. The
first assumption was that the valve was plugged up, so they put the cylinder
into liquid air (I guess to liquefy or freeze the gas inside, so it wouldn't
be under pressure) and unscrewed the valve from the cylinder. Still nothing
came out, so he sawed the cylinder open with a hacksaw. Inside was this
white solid material, polytetrafluoroethylene. His boss was mad because he
had ruined a perfectly good gas cylinder...

I may be wrong, but I interpreted the stickyness problem
to be in the glue of the piece attached to the dash.. in which
case I would suggest lightly sanding (at least not armor-alling)
the area where you are trying to get it to stay. I too use
Radio Shack "hook and loop" tape, but I don't know if it's
heavy duty. Of course, it's only holding a Pro34 vertically
which might not put too much stress on the hold.

Remember the golden rule of velcro, the more area covered on
both surfaces, the better the hold.

Don, all I suspect limiting would do to either generator is reduce the noise
content on the skirts by maybe 3dB unless there is a strange AGC network that
is many MHz wide at work introducing noise. Some generators DO have leveling
circuitry that is not filtered that could cause this. I'd be hard pressed to
believe this in an HP generator of recent vintage. A narrow band filter is
a better solution. It'll knock the noise sidebands on the test oscillator down
to reasonable proportions. (This exercise DOES point out how important GOOD
oscillator design is in mixers.)

Yes RADAR primarily uses waveguide for the microwave transmission lines,
however if you've ever looked at one of those old WWII radar sets you'll
see lots and lots of coax patch cords tying together all the rack mounted
sub-assemblies and such.

(K6X0)
...yes, Virginia, there is a real citizen's band between
160 and 190 KHz. The limitations are: one watt output power, and
the antenna can be no longer than 50 feet including the feedline.
There are some serious experimenters using the band for propagation
studies and so on, but there is lots of room for CW signals. You
may hear several beacons operating there 24 hours a day. There is
a newsletter, but I do not know who publishes it. Other than the
power and antenna restrictions, as far as I know anything goes.
To my knowledge there is no commercially made equipment available
for this band - virtually everyone builds their own transmitters,
and most of the modern receivers will tune down on that band. I
listen there once in a while with my TS-930 but have never been
interested in transmitting there. Good luck.

****

(KC6WUG)

...FCC part 15 (no license) 1750 meter band: 160-190 KHz. 1 watt max
input power. 15 meter maximum lenght of antenna + feedline. With
those power and antenna restrictions you don't get much range.

****

>From jkearman@arrl.org Fri Jun 5 07:55:06 1992
(KR1S) ^^^^
|------(AhHA! - So much for the benign neglect theory --
JRP)

JP: Well, shucks. We have run articles about this band in the past.
I guess we should do it again. The band runs from 160-190 kHz. You're
allowed 1-watt output, total length/height of antenna including
feed line is 50 ft (max allowed by law). Most folks put the xmtr
right at the base of the antenna.

You can join the Longwave Club of America, which was organized in
1974 to promote DXing and experimentation on frequencies below
550 kHz and activity on the 1750 meter band. Membership in the
LWCA and a one-year subscription to The LOWDOWN is $12.00 by
First Class Mail. Please make all remittances payable to the
Longwave Club, and mail to LWCA, 45 Wildflower Rd., Levittown,
PA 19057. [Direct quote from the LOWDOWN]

(See, we READ it here!)

The LOWDOWN is published monthly. Good luck and 73,

****

>From: pdh@netcom.com (Phil Howard)
(KA9WGN)

Depending on your effective bandwidth, you can extend it. I've read
about very slow digital going something like 1000 to 2000 km.

****

As promised, here's the summary of the information I requested
from the net a couple weeks ago regarding the 1750 meter band.

Does one need a license to operate on this band? No. This means that
you can choose your own callsign although callsigns are not required.

What is this band for? Experimentation mainly. It is especially fun to
attempt QRP operation and one respondent said that given the right type
of modulation and antenna setup, signals can travel 1000 miles or more
with just under one watt output! Lots of folks use CW beacons and there is
a radio club called The Lowfers (Low Frequency Users, presumedly). Be
aware that this IS NOT a ham band although several LF receiver manu-
facturers boast that their units can "receive the 1750-meter ham band".

You will not find discussion of this band in the ARRL publications
BECAUSE it is not a ham band. Perhaps some of the confusion here arises
from the use by LF operators of ham radio callsigns. Many hams also
operate in this band and use their own calls for identification, even
though, as mentioned above, a callsign is not required here.

What is the frequency limits of this band? The 1750 meter band spans
from 160 to 190 KHz.

What types of modulation may be employed? You may use CW and AM voice.
You may be allowed others (FM, RTTY, etc). But the data I was able to
gether was sketchy on this point. One person though said that there
are no restrictions on modulation methods.

What are the legal power limits and other transmitter-related
restrictions? Transmitter power is limited to somewhat less than one
watt output. The maximum power INPUT to the final should not exceed one
watt. The length of the antenna added to the length of the feedline
MAY NOT exceed 50 feet. Spurious emissions outside the band must be
60db below the signal strength at the carrier frequency.

Who may use the band? Anyone, so long as they comply with the above
regulations.

Where can I get more definitive and detailed information on this band?
The band is discussed in Part 15 of the Code of Federal Regulations which
you can pick up at your local library (assuming it is a fairly big
library),
or you can order it from the nearest US Government Bookstore. If any-
one knows where such a store is, please post its location. I'd like
to snag a copy of Part 15 myself.

Thanks to alan@dsd.es.com, kludge@grissom.larc.nasa.gov,
kc2wz!bob%fdurt1@uunet.UU.NET, brown@hpspkla.spk.hp.com, markz@ssc.wa.com,
and gary@ke4zv.uucp for all the information they provided.

Happy Lowfering! :-)

I wonder what kind of noise performance this part sports. Be sure to figure out what it uses for a reference frequency, and look for the reference sidebands. If the reference frequency is very high, the sidebands would be far removed from the primary output frequency.

>Let's see... we create a magazine specifically to cater to the needs
>of the amateur experimenter, and that's viewed by some as discouraging
>experimentation. How strange.

Good point. I didn't think of it in this way.

>In fact, QEX is 32 pages each month. If we thought it would be a good
>idea to put that material in QST--and we don't--we'd have to come up
>with about the same number of pages of additional QST advertising to
>pay for it. From where, I don't know. Might have to raise membership
>dues, too.

Does QEX contain advertising? If it is a solid 32 pages per month and
another 32 would be needed in advertising, the additional 64 pages
would be a significant increase in the size of QST. I admit that the
increased costs could justify leaving it out.

>The reason why we put a particular article in QEX instead of QST has
>to do with the audience we think the material serves. What is the
>benefit of putting into a magazine that goes to 170,000 readers
>material that might interest only a fraction of a percent of them?
>That would be criminally wasteful. The advantage of running material
>in QEX is that it is targeted to the particular community that will
>find it of interest.

This, doesn't quite ring true. The new ham section also targets a
fraction of the audience albeit probably a larger fraction than the
technical crowd.

No matter what the article is about, it targets a fraction of the ham
audience. Many for instance, do not build projects at all.

Further, the ARRL is supposed to be an organization for all hams. Why
discriminate against the hackers?

>At $12/year (for ARRL members in the US), I think QEX is a bargain.

Well then the cost for QEX isn't $12 per year but rather $30+$12 = $42
for ARRL members and $24 (?) for non-members.

The question shouldn't be if $12 is a bargain but rather whether
$24-$42 is a bargain. Is it? I don't know.

>(I'm prejudiced, of course--I edit QEX.)

Thanks for the honesty in the matter. It is much appreciated and
certainly a cut above the integrity that is typical on USENET.

Of course, there remains the question of why nobody hears about QEX outside of the ARRL community. Further, even inside the ARRL, QEX is rarely discussed. The ARRL doesn't seem to market it well either in QST or in supplementary mailings.

1969. DSP for the HOMEBREWER??

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-28 05:44:20 UTC
From: n9rzc@uiuc.edu
Message-ID: <n9rzc-2807940047130001@ruger-42.slip.uiuc.edu>
Source record: 117006

Hello everyone,

This may have passed around here a bit, I'm sorry that my work keeps me away from this news group too much, but then again, I wouldn't be able to be sitting here if I didn't work for food :)

-I was wondering if there were schematics/plans/kits out there for DSP filters (that would work as a DSP for Ham uses)

I really don't know that much about DSP, and have this great DSP chip that I am not willing to part with. I can get the specs/schematics etc from the company that makes this chip, but as for the rest of the circuitry I am purely stuck. (and I don't want to pay the $700 that the company wants for their fancy smancy dsp board- heck, all I want is an input, and an output- not a fregeebers HP workstation interface for the dsp- it'd be neat I guess, but I just don't need it right now).

SOOooo, I guess I would love to hear from anyone concerning kits, plans, schematics, articles, and personal advice.

I have enjoyed this group quite a bit, and more importantly, I have recieved a bunch of GREAT advice/help from everyone in the past, so I know this is the place to ask about this, especially because I am completely knew to HF, and especially DSP.

THANKS A TON TO EVERYONE AHEAD OF TIME!!!!

73!
Allen Hall n9rzc@uiuc.edu

ps- I'll try to catch the responses on this group, but I would really appreciate e-mail if you can, since I really have a hard time getting to the net nowadays (finals are upon us again!)

1970. MGF1200

Message-ID: <9407280905.aa14709@olympus.ee.surrey.ac.uk>
Source record: 117009

I have an old SSB electronics 2.3 GHz transvertor. The front end FET is US so I need to replace it. The original design used an MFG1200. Now I don't seem to be able to find one of these. I have replaced it with an ATF10135, but I am experiencing instability as it has more HF gain. Would an MGF1302 be more appropriate? Alternatively, where can one find MGF1200s?

>
>Any advice is welcome.../Andy

Actually, I think you'll find that it's *easier* to build the equipment
at higher frequencies than at lower frequencies. That's because there
are unconditionally stable packaged ICs available that make the job rather
mundane. Building RF equipment with discrete components in the upper HF and
lower VHF range is usually *much* more difficult than building equipment at
UHF and microwave where packaged components like MMICs are widely and cheaply
available, and where relatively small stripline or cavity resonators are
practical. Trying to tame strays and parasitics at upper HF and lower VHF
in discrete designs can be a real bear.

>Just wondering,
>Galen, KF0YJ

Sure, you can use PIN diode switches instead of relays. *Matched* 100 watt switches are practical. However, to emulate the double pole double throw relays used to switch an inline amp is a bit more complicated than just doing a TR switch. If you don't need the switching speed, the relays remain simpler and cheaper.

Your switching bias has to be stronger than the RF signal in order to keep a diode switch in the OFF state. That becomes a bit challenging at the 100 watt level where the RF voltage can be 70.7 V RMS with unity SWR. If SWR rises, the voltage needed can become ridiculous.

>sort of thing?

This unit is a *panadapter* designed to work at the IF frequency of
Heath receivers. The achievable dispersion is limited by the IF
selectivity of the receiver. If the receiver tunes the frequency
range that you need to test your amplifiers or filters, and if the
dispersion allowed by the receiver is sufficient, it can be pressed
into service. However, for amplifiers, you'd like a wide enough
dispersion to show fundamental and harmonics of an amplifier. I
sincerely doubt you could make the SB-620 do that.

>situation? Please send me any ideas or references as to how I could build
>this device and if and how I will need to use it to transmit identification.

Use the MC2833, Joel. It's a single chip FM transmitter with about 10 mW
output. That should be sufficient unless these rockets are *really* big.
Motorola has an app note available that will give the details needed to
make a transmitter with this chip.

97.215 only waives the ID requirement if you are transmitting *to* a
model for telecommand purposes. To transmit *from* a model for telemetry
purposes, you have to follow the ID rules. There are custom chips available
that will generate a MCW ID on contact closure. They're intended to be
mounted inside rigs so you can ID a stolen rig if you hear it on the air.
Look for the ad in QST. Or, if you're going to have a data acquisition
system to format the telemetry anyway, you can program the microcontroller
to also generate an ID for you. If you use ASCII telemetry, the callsign
can be included in ASCII, and an ordinary modem used for decoding.

Although I can't recall who at the moment there are kit manufacturers that provide complete transceive and transverter operations.

There is a well known Canadian 'Lowfer' that operates a coherent CW beacon and was featured on SPECTRUM (the weekend Radio Show about the radio hobby and is heard weekly 10:00PM Saturday on 5.810 Mhz). The coherent CW signal has en equivalent 1Kw erp (legal, since it's coherent CW). For more info on this technology refer to the ARRL publications.

The SB-620 *can* be used as a spectrum analyzer; there's a switch on the back that changes between "panadaptor" mode and spectrum analyzer mode. It can be adapted for many different IF frequencies, not just those used by Heath; in fact, the components and instructions for this are included with the kit. (I built one a _very_ long time ago.) So if anyone has one of these beasts and has used it in spectrum analyzer mode, I'd like to find out how well it works.

Actually, it also has a spectrum analyzer mode, although I don't see anyone using it much. This requires an external RF source to inject, along with the signal. They are beat together internally to form an IF which is then displayed.

It's crude and cheap, but you can pick them up for $50 at hamfests all the time. $90 is too much... I got mine for $20 at the Frostfest.

IC chip help
I'm trying to develop a circuit that uses the output signal lines from a CMOS IC
chip to drive a group relays (5 total) in an automatic antenna switching unit.
The problem is that the level of the output signals from the chip are too low to
directly drive the coils of the relays (they need 5V @ 200-300 mA). One solution
that I have come up with is to feed the chip's output signals to a group of
switching transisitors used to drive the relay coils.

Does anyone know of a chip that I could use to replace the group of
transistors ?

Scott, there have been several descriptions of modifying 27 MHz CB's to 28 MHz. A quick look through my collection of stuff has located;

"Inexpensive SSB for 10 M" - "modify this CB for 10-meter needs"

by Phil Salas AD5X- in HAM RADIO Magazine June '90.

Phil describes how to modfy a Cobra model 146GTL. Fully detailled. He makes it look simple.

>Does anyone have a schematic for a nicad charger built around the
>MAX713 nicad fast charge controller chip?

I have the data sheet for the '713 here. They say that you can call
1-800-998-8800 for free samples or literature.

I proto'ed the '713 up, and tried it out. While it worked in concept, I felt
that it allowed the battery packs to get too hot before the peak-sensing
circuit kicked out the fast charge current.

I'm going to use an ICS chip next, which uses the patented reverse pulse
charging technology. This method is supposedly better for NiCads, and is
claimed to about double the number of charge/discharge cycles you can get from
a battery pack. I'll wait until I see my own results before I believe or
disbelieve this.

I think you are right that an invention made coax popular, but it was the invention (or rather the commercial production) of polyethylene that made it economically and technically practical. It was the first CHEAP, flexible, extrudable plastic available suitable for the task. (Nylon was in wide use for fibers, polystyrene was commonly molded, and cellulose (rayon, cellophane) had been around for years, but is not really a plastic.

There were coax cables available in the late '30's that were made from copper tubing and wire, hand-assembled using polystyrene beads for spacers. Needless to say, they were not widely used by amateurs!

>UPS handles the rest of the problem <grin>!

Good suggestion on the PC (switching) power supplies. However, be careful
about the ground. An ground which is indepenent of the ground/neutral bond
(located at the distribution panel) could create a nice ground loop. Most
modern Ham gear has a separate RF ground and safety ground (since most is 12
VDC), but this is not the case with tube based gear. Follow NEC to the letter
on grounding, and avoiding the ground loops. They are a real pain.

I noticed a strange phenomenon two nights ago -- or rather, I tracked it down, but it's been annoying me for months.

I've been plagued for a long time with a strange signal -- sounded like "louder" white noise -- that was recieved in a number of places in the HF bands. Because it sounded like some kind of wierd digital modulation, kind of like a high-speed modem, I assumed it was some kind of external interference.

A couple of nights ago, I tuned across the interference, and for no apparent reason, hit the FM button on my receiver. Suddenly, the noise became coherent: it was the tone generators on the clock, and I verified that it was the clock because one of the tones changed in time with the "tick-tock" sound -- and at the right pitch. The full chime sound could also be heard on the FM signal. I then did some fishing and discovered that the signal was repeated every 375 KHz starting from about 14 MHz. I couldn't find it anywhere below 14 MHz, but it may have been because of the noise level.

Has anyone else had this problem? And what did you do about it? And how the heck can I get a 30 MHz FM signal from that clock?!

Hi Scott,

There are some companies in the back of magazines such as _QST_ and
_73_ that sell modification booklets to do just that. Give them a
try. Usually it will cost you around $20 for the book, and less
than that for the parts to make the changes.

By the way, do you have an amateur radio license? Your name doesn't
seem to be listed in the callbook.

Regards, and 73,

A commercial dealer selling coaxial relays, Surplus Sales of Nebraska,
402-346-4750, advertising in Nuts & Volts, sells SPDT coaxial
relays for $38+$4 s/h. They look nearly identical to two I have
for sale and are indicative of a SP6T relay assembly I have
for sale.

I'll sell you a SPDT relay for about half that price: $20 + $3 s/h.

RC has used 27 MHz, 72 MHz, Amateur 50 MHz and now a new band (don't know it). Have you noticed the transmitter and receiver antennas aren't changing? They just keep using random length wires and metal stick transmitting antennas. Tune the finals for best signal strength.

I cringe when I see a modeller cut the antenna off because it's longer than the length of the wing.

Summary: Don't worry about the receive antenna. Just use a piece of wire. Your Amatuer Radio knowledge it showing through! :) Just pretend you don't know what you know.

Has anybody seen software to record & playback / synthesize TV/VCR
IR remote signals using the parallel or serial port on an msdos computer?

Photo diode, > serial port dsr line (or something)
CTS line (or something) > IR LED.

I already have a universal remote hardwired through analog mux to the
parallel port, problem is, about 1 yr of battery life. Batterys go dead, the
remote dumps all the programs.(This is in use by a paralysed friend who
cant easily reprogram the remote again.)

I would like to be able to store data to a disk and then "PlayBack" IR
commands either from disk or ram memory.

Any info would be useful.

Thanks.

The 1858-0097 is a Sprague ULN-2023A, which is an array of 7 darlington transistors. I notice that Mouser Electronics (800-346-6873) sells a number of other ULN-xxxx darlington arrays. You might call and ask them if they can get the -2023, or maybe one of the others is a pin-compatible replacement.

With an unbalanced mixer, any broadband noise out of the signal generator
(whether phase noise or AM noise) will go right into the IF amplifier,
causing an increase in measured noise figure. Since the 8644 has better
phase noise than the 8657, it stands to reason that it would work better.
I believe that the 8640 has even better phase noise far from the carrier
frequency, due to the 8640's cavity-tuned oscillator (which has a much
higher resonator Q than the VCO's used in the synthesized signal
generators.)

The solution is either to use a balanced mixer or a local oscillator
with a tuned output.

And the old HP 608 signal generator has better far out noise than
any currently manufactured signal generator. This is because it
has a tuned amplifier following the oscillator. The amplifier
tuning tracks with the oscillator tuning.

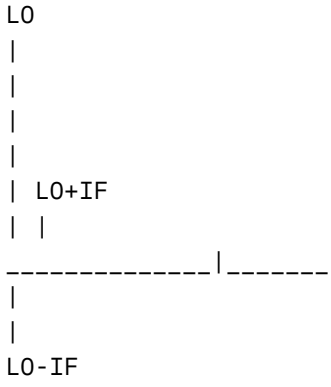
Alan's point about excess noise from the LO source at the IF frequency
(70 MHz) getting into the unbalanced mixer is very important; in my initial
response I forgot about this.

Suppose that this excess noise at F(if) has been filtered off. You still
might have a problem with noise offset from the LO by +-21.4 MHz, as was
mentioned earlier. I will explain why I think it is the AM noise, not the
phase noise, which causes the increased mixer noise figure. If the LO
has been limited so that no AM is present, then you have a pure FM spectrum
as shown here ...



Here, the upper and lower sidebands represent noise, but since no AM noise is
present the upper and lower sidebands are anti-correlated (shown by the lower
sideband going down). Thus, the upper sideband will mix down to the IF, but
the lower sideband also mixes down and cancellation occurs.

Comments?

That being said, I still think the best solution is the balanced mixer.
Putting a tuned filter on the LO would be tough since it would need to

be rather narrow-band, and limiting the LO would be more work than just getting a nice double balanced mixer.

Alan, this, together with your code complaints on .policy, is nauseating.
The previous poster had good reason to say what he said. The FCC
dictates that the amateur radio service be self-policing, meaning
we look after ourselves and each other; it's our responsibility to
help keep unlicensed operators off the ham bands.

This thread revolves around converting a CB radio to 10M or there abouts;
CB'ers are moving from 11M to 10.5M and illegally operating. That the
original poster is not listed in the callbook makes some of us
suspicious of his intentions.

Note that Dave asked about his license in a nice way.

>Comments?

As a matter of fact yes. Feeding a signal into a mixer stage generally requires SOME form of frequency sensitive network, be it a tuned circuit or a simple RC circuit between a FET's gate and ground. This will upset the phase relations between the upper and lower sidebands. In the past I have gotten best preditions based on total sideband power. (Within a few dB.) But I do note that I dispise single ended mixers if I have the power. Given enough power I go to double balanced quads. This gives even MORE "junk" suppression and generally a modest boost in IP3.

That said I pulled a different design long ago on a "how small can you make it" black world project. I starved the mixer for power. The LO *AND* the signal were both so low power that the noise from the SAW LO was ignoreable in the mixer. It had *LOUSEY* IMD and crossmod and IF rejection and all that. But it was for use where the RF environment was generally less than awful.

>how the heck can I get a 30 MHz FM signal from that clock?!

Welcome to the 1990s! It seems that everything today has a pile of digital electronics in it, and digital electronics radiate. (Remember that a perfect square wave has an infinite number of harmonics, and you are seeing some of them at 30 MHz).

First of all, if the clock has a vacuum fluorescent display, you are probably in real trouble. I have had no luck reducing RFI from these things, other than by recycling them.

The first step is to add capacitance to the power supply line as close to the source as possible (and a .1 MFD ceramic is a good start). Most of the worst of the RF is radiated through the power lines, so if you cut off the noise at the chip, you're doing well. After this, you can start adding capacitance to the LED driver outputs, just on each pin of the matrix to ground. Again a .1 MFD ceramic from the junk box is a good start. Also look for bad grounds, corroded ground wires, and the like.

This fixes the majority of problems with small digital gadgets. Some of them take some more work, but this usually does it, and since the next step is shielding the case, you might not want to get that far anyway. I deal with this stuff all the time... at home my solution has been just to banish it from the house.

After reading several posts in this interesting thread, I happened to be leaf-
ing through an old magazine last night, and there it was. Thought that others
may enjoy the story of a man who was there, so I will attempt to abstract.

From: Bill Orr, W6SAI - "Coax Revisited" - Ham Radio, Jun'89
Time: mid-summer 1941
Place: Douglas Aircraft assembly plant, assembly line for the A20 (Boston)
attack bomber.

Orr says he and co-worker W6KJI were in the crowded tail section of a near
complete A20. Orr had turned on the 100 W. transmitter a few minutes before
and left it key-down for testing. His friend sad, "Feel the cable". It was
no surprise to Orr that the cable was, "very warm to the touch". The old
coax used "copolene" dielectric.

His friend lead him out of the plane and showed him new coax called WC549
and a box of "new style" fittings designated PL-259 and SO-239. Starting
with plane #386, this coax with brand new polyethylene dielectric and
"glistening in a black jacket" was to be used.

So there you have it... the exact time for the historic moment.

Orr goes on to talk about miles of coax being sold as surplus after the was
at 2 - 5 cents/foot !

This 52 ohm coax was later renamed RG-8/U ; RG = Radio Guide, 8 = type,
and U = utility service. It was later changed to 50 ohm with the
designation RG-213/U. At the same time 53.5 ohm RG-58/U was changed
to 50 ohm RG-58A/U and later to RG-58C/U.

Orr also goes into the quality scam which arose from the government
dropping the RG-8/U mil spec.

An interesting and useful point made by Orr is that RG-213/U or good
RG-8/U will weigh about 11 lbs./100 ft., while cheap RG-8/U will
weight as little as 8 lbs./100 ft. (note: foam differs)

If I may blow my own horn for a moment, the latest Electronics Now (which arrived today) contains an article I wrote called "New Life for Old Oscilloscopes," complete with a schematic of a Heath IO-12.

What's amusing is that they bought the article from me in 1990, and I wondered for a while if it had been forgotten. But the information is at least as useful today as it was then.

There's also a book on old oscilloscopes being sold by Tucker Electronics. Has anyone seen it? I haven't, but it sounds like a useful thing.

Yes, the ULN-2003 or ULN-2803 from Allegro (formerly Sprague). These are 7 or 8 darlington relay drivers per package. Damper diodes included. These are 'Jelly Bean' devices, available from many manufacturers.

The ULN-2023 is a 95 volt version of the -2003, which is rated at 50 volts. $0.83 each in an older Newark catalog.

>
>P.S. Does anyone know what a varactor diode is and where I can get one?

Use a 556 timer with one timer set for 1/2 sec and the other set for 10 sec.
Then use the outputs in parallel to drive a transistor, relay etc.

A Varactor diode, sometimes called a varicap is a 'diode' who's capacitance
is varied by a DC bias voltage; often used to electronically tune radios. Most
of the major distribs. should carry them i.e. mouser, digi-key etc.

Receivers of this type are frequently used for single-channel monitors
(i.e. pilot-carrier monitor receivers, etc.)

However, things like 'walky-talkies' use regenerative receivers. These
are typically as broad as a barn door (100's of kilohertz wide...)
and tuned only by the obvious coil that is in the WT. The crystal
has nothing to do with this type of receiver. In fact, the crystal itself
is probably a 3rd overtone...

Regenerative receivers of this type are useful primarily for AM detection
and wideband FM. They radiate a lot of "noise" as well when they operate
and typically, they are not extremely sensitive...

If the Walky-Talkie has only a few transistors, it most likely uses this
type of receiver. The transmitter uses the speaker amplifier for
modulation...

Actually, there is nothing particularly tricky about a stepper-motor driver.

I would guess that this stepper has 5 wires: A "common" and 4 others,
one for each phase.

A driver is pretty simple. First, determine the operating voltage of the
motor. Many implementations run the stepper at, say, 24 volts for
high torque and fast stepping, and then reduce the voltage to 5 or 12 volts
to reduce power dissapation.

In the past, I used a 24 volt stepper from an old 8" disk drive and ran it
at 12 volts. This provided plenty of torque and a fast enough stepping
rate for the application (i.e. steering a telescope...)

The stepper driver was very simple: The "common" wire on the motor was tied
to 12 volts (with a 1000uf capacitor, etc...) A diode is connected
across each winding to quench any back EMF.

I just used an NPN (emitter grounded, 4.7k resistor on the base from a
digital (CMOS) driving source. The transistor was nothing special
(PN2222... or anything that can switch several hundred milliamps...)

Of course, the driving sequence for the windings must be correct, but
I did this by simple lookup table in software. I also designed a
circuit using a few gates that converted a simple binary count to the
proper sequence for exciting the windings...

2017. COAX RELAY For Sale details

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-31 21:07:03 UTC
From: bmork@opus-ovh.spk.wa.us
Message-ID: <gegcqc7w165w@opus-ovh.spk.wa.us>
Source record: 116964
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics,rec.radio.swap

Several people have returned messages asking for details about the coax relays I have for sale. Here's a more complete description of what I have.

I have three coax relays that I am no longer using. All are milled out of solid metal and plated. Two are 2-pole switches and the other is a 6-pole switch. The 2-pole switches appear similar to what Surplus Sales of Nebraska (402-346-4750) sells for $38+$4s/h. See the picture on page 40 of the July issue of Nuts & Volts. Theirs are spec'd at 100w, 500MHz, 1 amp contacts, 18-32 vdc coil. The coil on my unit appears a little less bulky than theirs and measures 280 ohms static DC resistance. All three relay assemblies I'm selling are in good condition, fully functional.

1:6 coax relay:

A 3" x 2.5" block of metal with a central BNC sticking out of the middle. On either side are vertical stacks of 3 BNC connectors. On the back are six coils (stamped with "26 VDC"). Down the center, between the two sets of 3 coils is an inspection plate.

Removing the inspection plate shows a brass? copper? bar soldered directly to the central BNC center pin and held in position at the extemes with teflon spacers. Each relay, when energized, lowers a flexible metal strip onto the bar. Each flexible metal strip, in turn, goes to a BNC center connector. The shield of all BNC connectors are silver soldered directly to the block. All six contacts appear to be normally open, and close upon relay actuation.

1:2 coax relays:

The other two are identical milled bars (instead of blocks) with similar central feed and two other BNCs on the left or right. Construction is comparable, except the relay moves two plastic pins that simultaneously switch contacts on both BNCs. On these, one output is normally open, the other is normally closed.

-- a short bandwagon speech:
I've purchased/sold a bunch through Internet and recently advertised a Private Pilot study course with a price and received 12+ responses. How do I best sell N items to N+x people?! Simultaneously, I advertised an analytical balance with no price (asking for any offers for the valuable white elephant) and pretty much received hate mail from a user.
Here's my next best plan, layed out for your acceptance or critique:

I advertised the 1:2 relays on the net for $19+$3s/h. If you'd like one or both relays at that price, pre-paid with a postal money order, let me know.

Any more than two takers and I'll pull e-mail addresses from a hat.
Anybody who offers to prepay more with a postal money order, will get first dibs. I'll sell the 6-pole switch to the highest offer to pre-pay.

2018. Optoelec's 3000A handicounter review

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-07-31 21:38:44 UTC
From: bmork@opus-ovh.spk.wa.us
Message-ID: <0uHcqc1w165w@opus-ovh.spk.wa.us>
Source record: 116965
Cross-posted to: sci.electronics,rec.radio.amateur.homebrew,rec.radio.amateur.equipment

Optoelectronics 3000A Product Review - September 1993
Copyright (c) 93,94 Brian Mork -- "not to make money, but to keep it that way for others."

>>> HISTORY
June 19th of 1993, I distributed a product review of Optoelectronics' 3000A handicounter. It had bad dBm calculations. A 29 July distribution fixed these errors and the text was cleaned up in other ways. More complete input sensitivities were reported. This version includes subsequent perspective after use of OE's M1 handicounter (see the M1 product review of this same date -- it is a pared down version of the 3000A). Damien Thorn (Internet drdamien@delphi.com) wrote a non-technical review article on several of OE's products (covering more why you'd want them and what to do with them once you own them) that appeared in the August 1993 issue of Nuts & Volts.

>>> ABSTRACT
A 10Hz-3GHz feature-laden counter/timer/frequency meter could be a good addition to your shack if you don't have the functionality yet. There are some disallowed configurations that give you less than you may think if you casually read the laundry list of features. Input specifications need more attention or at least acknowledgement of real-life problems.

>>> CONSTRUCTION
The case is an extruded U-channel of aluminum with a flat top plate and end plates. The end plates screw into the U-channel with four screws, one of which is a machine screw. This one is by the A input, apparently designed to provide a better "bite" into an interior copper shielding plate around the A input.

A single 9.2cm x 12.6cm circuit board lies under the faceplate, directly mounting the three buttons and six slide switches, which, in turn, poke through the front plate. A piggyback (piggyfront?) board holds the LCD display. There are two main chips--the OE10 vaulted in Optoelectronics' marketing literature and an SC87C51. My 8751 is labeled M1.3000A 5.20.93 VER 2.1 with a little sticky label. The two main chips and a transformer on the board have a white chalky substance around them as if they were hand soldered and the flux vapors weren't cleaned off. Hope it doesn't corrode. Probably 200 additional components, mostly surface mounted, also occupy the circuit board.

The six batteries are stuck to the back shell (double sided tape?). The two battery wires terminate on the circuit board with a separable connector. The batteries' weight and the solid aluminum case give the unit a solid feel. Neither the wall-wart charging unit or the 3000A itself have

a charging light. For the extra resistor and LED, I would like one. Too many times I've had some master switch, wall switch or loose plug inadvertently negate my effort to charge batteries. And when do you find out? When you needed the unit to be charged.

There are three plastic sheets stuck on the external top and face of the unit. My top piece was peeling off slightly. The front bottom one was crooked enough to let Button 2 not bounce back up. Slight trimming fixed that. I can't tell if the white lettering is applied on top of the plastic or behind the plastic. I hope it's behind so that they don't wear off. All the aluminum is painted black --not drippy, but it has the appearance of thick enamel. Personally, I would much rather have black anodized so there would be no possibility of chipping paint.

>>> OWNER'S MANUAL
It's five sheets of photocopied 8-1/2" x 11", printed in landscape mode and folded in half. It's short, but operation of the 3000A is easy, so maybe a lot isn't needed. I would propose inclusion of a few diagrams and tables rather than all linear text description. Included in the manual are:

Features description..... 2 pages
Specifications..... 1 page
Operation..... 2 pages
Data Interface..... 2 pages
Block schematic..... 2 pages
Operation hints..... 4 pages
Battery & Power..... 1 page
Calibration..... 1 page
Warrantee..... 1 page
Service & Return..... 1 page

A loose sheet of paper describes how to turn on the backlight option.

I wanted to know what I could plug into this meter. Nowhere in the specs or owner's manual are the max input ratings. After talking with the factory (toll call is small compared to the purchase price, but still is annoying), I find the 1 Mohm inputs can handle a maximum on the order of 50 volts AC+DC. The Model 3000 (not the 3000A) specified 100V RMS as the maximum. Anyhow, I feel good about plugging in TTL.

DON'T plug TTL into the inputs if the 50 ohm switch is selected! More subtly, be sure you *unplug* it before you slide the switch to the 50 ohm position. The same phone call revealed that the 50 ohm inputs handle a maximum of +15 dBm. That's 1.2 volts RMS in a 50-ohm system, corresponding to 3.4 volts Peak-to-Peak if the waveform is a sine wave. Another user was told by a factory technician that "a 5W HT connected to the counter input for a short time would not damage the counter." Five watts is about +37 dBm! Does the amount of time matter? The correct numbers need to be in an Owner's Manual, especially since the warranty excludes "damage to the input circuitry from the application of an excessive input signal."

I would suggest making no direct electrical connections to the 50 ohm amps. Only antenna type inputs should be used when the 50 ohm amps are selected. I've wrapped an 8" wire (snake like) around cordless phone antennas, and that works ok, but even this would be *way* to much for a 100W HF transmitter. Be careful. Full scale bar graph ranges from 2 - 4 mV, depending on the frequency. If you stay on scale, you're safe, but most of the valid input window is above "full scale." In the range 4 mV to approximately 1200 mV, you'll be increasing power "in the blind."

>>> OPERATION
Some non-obvious combinations of functions and inputs is the order of the day. This is kind of weird, but is intentional to give you the best sensitivity possible, using a number of specialized input amps.

Turn it on, holding down a Button 2 if you want the optional backlight to come on. Button 3 selects the gate time (resolution). With a slide switch, you select either 1 Mohm (Hi-Z) or 50 ohm (Lo-Z) amplifiers.

If you select Hi-Z inputs, Button 1 selects either/both A and B inputs. Button 2 rotates between FREQUENCY, PERIOD, INTERVAL, and RATIO. Input A measures only 10Hz - 50MHz, with sensitivity of a few tens of millivolts. Input B measures only 10Hz - 10MHz, with a sensitivity of better than ten millivolts.

If you select Lo-Z inputs, a signal strength bar-graph indication automatically appears and you must select one of three input amps:

Input A only, from 10MHz - 220MHz (0.3 to 5mV sensitivity)
Input A only, from 10MHz - 880MHz (divide by 4 prescaler)
Input B only, from 500MHz - 3000MHz (new amp, div by 16 prescaler)

On one of OE's product literature flyers, they speak of a 1-200MHz input. A phone call confirmed that this range exists only as a typo on the product literature flyer.

In parallel with all the above input selections, two switches let you operate in either of four modes. I'll call them modes 00, 01, 10, and 11, representing whether FILTER and CAPTURE, respectively, are off (0) or on (1).

00 (FILTER off, CAPTURE off) Operates as described above. This is the single mode of the original Model 3000. Meter shows updated values even if it's counting noise. Gate light blinks continuously.

10 (FILTER on, CAPTURE off) PERIOD, INTERVAL and RATIO are disabled. Computer logic looks for meaningful oscillations, providing a new frequency value only if a legitimate count is acquired. A higher level of filtering can be selected by holding down Button 3 during power up.

11 (FILTER on, CAPTURE on) Same as mode 10 except nothing happens until you arm the system by pressing Button 2. Once you do this, the word "frequency" flashes on the display until a legitimate

count is snagged. A three-memory buffer (the display plus two more) keeps previous values. They are referred to as X, A, and B. X contains the most recent, A the second most recent, and B the third most recent. When a fourth value is snagged, the value in B is lost.

01 (FILTER off, CAPTURE on) In this mode, no measurements are taken. Button 2 rotates between the three memories recorded in mode 11.

>>> PRODUCT SUPPORT
In some sense, there's not much to support. The meter either works or it doesn't. Operation is very straight forward. I don't call to harass service personnel and I *do* read the manuals first. I did call to find out about the input characteristics as discussed above and was, well, not impressed.

Female answers and I ask for service or tech help. After 2 minutes, the line drops dead. I call back. Same female passes me on to Ray quickly this time. I ask Ray about input specs. He says that, yes indeed, that has been inadvertently left out of the manual. Stand by. Three minutes. Ray comes back with info. The 1 Mohm inputs are "plus 50 volt AC plus DC", the 50 ohm inputs are "plus 15 dBm." Yes, that's what I wanted! Follow up: What do you mean by 50v AC+DC?" Hmmm. He didn't know; that's what the engineer told him. Ok. Is it capacitively coupled? Uhh.. the inputs go right into a "MAR6 amplifier." Could you please send me a copy of just the front end prior to the MAR6 amps? Pause... "Well, there's a capacitor that goes to ground." Yes, that's the kind of info I want. What size? Maybe a pf or two? "It's a 50v electrolytic." Eeee wrong person. Would he send me just a copy of the front end schematic? "No, we don't have anything like that I could send you." Ok, well thanks anyhow. Bye.

In retrospect, I should have asked for the engineer who was sourcing this information. Inputs are listed in the specifications as 1MHz, 30pf. This seems believable since it mimics a normal oscilloscope input. But are they AC or DC coupled? With what size, type & rating capacitor? I was hoping to use the INTERVAL or RATIO mode with Input B held open so I can count events on Input A. At Dayton a year back, I spoke with a man named Bill Owens who seemed to have a good handle on the company's history and the capability of the product line. I wish his knowledge was conveyed better to potential buyers.

>>> REAL LIFE
I have two regimes of interest for which I want this counter. The first is modem and ultrasonic work in the KHz to 100 KHz range. The second is radio VFO work, requiring MHz up to GHz. I characterized the 3000A with a 20Hz - 1MHz function generator, my Yaesu 757GX/Vectronics VC300DLP combo, and a Hewlett-Packard VHF/UHF generator.

--- low frequency ---
For the less than 1MHz work, the Hi-Z inputs are used. I have a 1MHz TXCO standard in my shack that has an output floating on the back side of

a little toroid transformer. It gives out approximately +-0.5v into my 500 Kohm load (3000A and oscilloscope in parallel). My 1MHz output shows up as a stable 6.00 Mhz on the 3000A. What?! Yes. Regardless of the filter selection (none, medium, or full), six megahertz kept being displayed. The waveform was not symmetric, I'll give that much, but it was very stable and clean from other high frequency hash. It looked sort of like this:

```
|\ |\ The waveform stayed the same regardless of
0 V___| -- | -- whether the 3000A was hooked up. The 3000A
| | | | counted the same regardless of whether the
-. .---. o'scope was hooked up. P-P voltage was 1.5v.
```

The 1MHz output from my TXCO was a square wave ranging between 0 and 2 volts. Regardless of the 3000A filter selection, it showed a frequency of 3.0 MHz. Another user working on a homebuilt oscillator also reports extreme sensitivity to harmonics. This harmonic sensitivity, combined with extreme sensitivity makes the instrument virtually useless when using any frequency multiples in your project: you won't know which signal is being locked onto.

I fired up a variable frequency / variable amplitude function generator and o'scope combination. The generator went to the scope with a BNC T-tap half way that plugged into the 3000A.

Using the A input, I needed incredulously large amplitudes--WAY above the specified <20 mV. Using the B input was even worse. The procedure used was to start at about 100 mV and go down first. If a stable count held, I reduced the PP voltage until spuratic readings were obtained. If 100 mV was giving spuratic or known-to-be-wrong numbers, I turned the amplitude up until a stable reading was obtained. The resultant measured PP voltages (asterisks indicate I never was able to get a good count):

Frequency	Input A	Input B
20 Hz	2 V (0.78 VRMS)	*
200 Hz	1 V	*
350 Hz	0.6 V	*
60 KHz	50 mV	4 V
500 KHz	<10 mV	1 V

Square wave counting was similar. For instance, 2 V PP was needed at 10 KHz to get a good count with Input A. In all cases, the scope showed clean signals with no high frequency hash. Testing at another ham's shack who had a fancy HP generator and scope yielded the same results within 10%. Stable operation of the Hi-Z input is mandatory to use the interval and period functions of the 3000A, and this condition does NOT seem to be met. I consider the non-frequency modes to be historical carry-overs from the product lines' 7226 counter heritage rather than useful features of OE's OE10 custom chip.

I own a PK232 radio modem and decided to see if the meter was good enough to tune the audio tones. With full output from the PK232 (about 0.5v PP on the scope, giving 140mV RMS on a Fluke DVM good to 10KHz), I stuck the tones into Input A and Input B with Hi-Z amps selected. The 2200Hz tone showed as 2265+-5Hz (A) and 23KHz (B), respectively. The 1200Hz tone showed as 1820+-15 (A) and 31KHz (B), respectively. No, I did not adjust the PK232.

--- high frequency ---
My RF test goal was simple. How accurate is my 757GX VFO? Working near 10MHz, the Lo-Z A input (only one suitable for this measurement) has an advertised sensitivity of <5mV. With a 12" dangling wire near the coax out the back of the radio, the counter was dominated with a signal at approximately 104 MHz (103.9 FM?). Later tests 25 miles across town again showed that with a wire pigtail antenna, it was being dominated with this station. I bought an RS15-577B FM trap and put it in line. Now a 68 MHz interference dominates, probably the local Channel 4 TV station.

I went back to the Hi-Z inputs. At this point I was trying to determine the electrical length of some coax. A 1/4 wavelength of coax is terminated with a short circuit, and fed in parallel with a 50 ohm load with a mid level RF power (see page 74 of the June 93 QST; the goal is to get a 1:1 SWR). The high current node at the terminator is the point I was trying to pickup RF with the 3000A. Twenty turns of perfboard wire around a pencil stepped up the voltage enough for the meter to register stable counts when the pickup coil was positioned near the end of the coax shorting wire loop.

Characterization of the three 50-ohm amps with an HP generator showed solid frequency locks at these random check points:

Fast Amp	Middle Amp	Slow Amp
800MHz, -47dBm, 1.0mV	100MHz, -65dBm, 0.12mV	150MHz, -60dBm, 0.22mV
1000MHz, -43dBm, 1.6mV	450MHz, -54dBm, 0.45mV	

Attempts to do PERIOD, INTERVAL, and RATIO measurements were unsuccessful due to the skittish behavior of the Hi-Z inputs.

>>> OPTIONS
You can buy a precision (0.2 ppm vs 1.0 ppm) timebase for an extra $100. What used to be a $45 backlight option now seems to be a non-optional extra expense. September advertisements still quote the lower price for the standard model, but the sales personnel won't sell one that way.

--- time base ---
There are two reasons why I did not want to buy the precision time-base option. One is because a RATIO mode is provided and I already have a precision 10MHz TTL oscillator scavenged from an old LORAN navigation board. 10MHz also happens to be the maximum frequency Input B accepted in the ratio mode (all ratios are A/B). What a coincidence. Works for me!

The second reason is simply that the 1ppm timebase is specified to age at a rate of 1ppm/year. A 0.2 ppm option would be degraded to the 1.0ppm option in only about 10 weeks. In any case, I usually don't need to know the last 2 Hz on a 10000000 Hz signal.

--- backlight ---
When it's on, I can hear a switching circuit bringing up a high voltage for the luminescent display. It turns off after 10 seconds of inactivity and comes on again when some button is pressed or frequency is acquired.

It looks good. Worth $45? The native display is plenty readable and the extra light actually makes reading it harder from angles "above" the counter.

>>> GOTCHAS
The serial interface is unidirectional. You send it a CR and it sends back 10 digits and a decimal point, in ASCII, 2400bps, 8 bits, no parity, 1 stop bit. It only works in FREQ mode. It provides only the most recent number, with no indication of whether this is another sample or the same number it just sent you after your last request. The interface can sink 1.6mA and source 0.06 mA.

Excellent amplifier sensitivity isn't everything. Sometimes it's even a burden. For decent counting, the signal you're monitoring must exceed the noise (combination of *all* other RF signals in the bandpass of the selected amp) floor by 10-15dB. Specified sensitivity ranges from -57dBm to -11dBm. The input amp is limited to +15dBm. Ambient noise, including FM stations hovers about -11dBm. Play with those numbers and you'll see that the window for a good count can be pretty small. Try to measure a cordless phone near your transmitter or computer monitor? Probably not. If you live near a broadcast station, good luck. I don't consider these numbers a design flaw given the intentionally wide frequency range of the amps, but it definitely affects your day-to-day operation.

In Damien's review, he emphasizes the importance of a limited bandwidth antenna. Take this recommendation seriously. Wide range frequency coverage means susceptibility to noise. A bandwidth limiting antenna helps mitigate this problem.

>>> SUMMARY
The at-your-door price for a 3.5" x 5" circuit board seems a bit high, but the counter is specified to do what I need it to do, plus a few options. Resolving the skittish Hi-Z input problems is a must. The M1 gets around this by simply not having multifunction capability. Paying the extra $100 for a 3000A with specified capabilities that in real life are marginally usable deserves a second thought.

All models are available only direct from the manufacturer in Florida. Contact Optoelectronics: 5821 NE 14th Avenue, Ft Lauderdale, FL 33334. 800-327-5912 or 305-771-2050. FAX 305-771-2052. Makes you want to dial ..2051 and see who you get, doesn't it? :)

Optoelectronics M1 Product Review - September 1993
Copyright (c) 93,94 Brian Mork -- "not to make money, but to keep it that way for others."

>>> HISTORY
In June of 1993, I distributed a product review of Optoelectronics' 3000A on Packet and Internet networks. It had bad dBm calculations. A July distribution fixed these errors and the text was cleaned up in other ways. More complete input sensitivities were reported. I now have an M1 counter and this review reflects the new experiences. A third version of the 3000A review is distributed concurrently.

>>> ABSTRACT
A 10 Hz - 2.4 GHz frequency meter could be a good addition to your shack if you don't have the functionality yet. The M1 is essentially a pared down version of the 3000A. At many places, this review assumes you have experience with the 3000A or have read that review. The 3000A I owned for a short while was returned because it was too tender and vulnerable to real-life conditions. Since then I've purchased an M1 and intend on keeping it. It is my recommendation to most people.

>>> CONSTRUCTION
The case is an extruded U-channel of aluminum with a flat top plate and end plates. The end plates screw into the U-channel with four screws, one of which is a machine screw. This one is apparently designed to provide a better "bite" into an interior copper shielding plate around the input. The gate LED on the M1 protrudes excessively from the LCD panel, unlike the 3000A LED, which was mounted to the same height as the switches and pushbuttons.

A single 6.5cm x 11.7cm circuit board lies under the faceplate, directly mounting the two buttons and five slide switches, which, in turn, poke through the front plate. A piggyback (piggyfront?) board holds the LCD display. There are two main chips--the OE10 vaulted in Optoelectronics' marketing literature and an SC87C51. The two main chips on the board have a white chalky substance around them as if they were hand soldered and the flux vapors weren't cleaned off. Hope it doesn't corrode. Probably 200 additional components, mostly surface mounted, also occupy the circuit board.

The M1 has four battery cells. Literature claims a recharge lasts about an hour less than the 3000A. My M1 ran for 6:50 on a full charge. The low battery indicators, although functional during the power-on check, never did illuminate during the battery run-down check. The counter just quit counting and a minute or two later the display faded.

A non-technical review of OE's products (covering more why you'd want them and what to do with them once you own them) written by Damien Thorn (Internet drdamien@delphi.com) appeared in the August 1993 issue of Nuts & Volts. He sounds like he enjoys his 3000A. I prefer the M1. The M1 costs $100 less.

>>> OWNER'S MANUAL
It's five sheets of photocopied 8-1/2" x 11", printed in landscape mode and folded in half. It's short, but operation of the M1 is easy, so maybe a lot isn't needed. I would propose inclusion of a few diagrams and tables rather than all linear text description. Included in the manual are:

Features description..... 2 pages
Specifications..... 1 page
Controls..... 2 pages
Data Interface..... 2 pages
Block schematic..... 2 blank pages
Using the Counter..... 4 pages
Battery & Power..... 1 page
Calibration..... 1 page
Warrantee..... 1 page
Service & Return..... 1 page

A loose sheet of paper gives an overall Block schematic.

The max input ratings match the 3000A. The 1 Mohm inputs handle a maximum on the order of 50 volts AC+DC (specified as 100 V RMS in the product literature flyer).

The 50 ohm switches have MUCH less range! Be sure you *unplug* large voltage sources (such as TTL) before you slide the switch to the 50 ohm position. They handle a maximum of "+15dBm or 50 milliwatts". These numbers don't quite match by my calculation (+15dBm is 32 mW). The range corresponds to approximately 1.2 RMS in a 50-ohm system, corresponding to 3.4 volts Peak-to-Peak if the waveform is a sine wave. Accurate numbers need to be available.

I would suggest making no direct electrical connections to the 50 ohm amps. Only antenna type inputs should be used when the 50 ohm amps are selected. I've wrapped an 8" wire (snake like) around cordless phone antennas, and that works ok, but even this would be *way* to much for a 100W HF transmitter. Be careful and use the bargraph. Full scale bar graph ranges from 10-20 mV, depending on the frequency. This covers a large range than the 3000A and seems to cover the range of real-life signals better, but it is less sensitive.

>>> OPERATION
Turn it on, holding down a Button 2 if you want the optional backlight to come on. When the backlight is on, I can hear a switching circuit bringing up a high voltage for the luminescent display. It turns off after 10 seconds of inactivity and comes on again when some button is pressed or

frequency is acquired.

Button 2 selects the gate time (resolution). With a slide switch, you select either 1 Mohm (Hi-Z) or 50 ohm (Lo-Z) amplifiers. The M1 has only one input, and is incapable of period, ratio, and interval measurements.

If you select Hi-Z input, you can count 10Hz - 50MHz, with a claimed sensitivity of a few tens of millivolts, identical to the 3000A Input A.

If you select Lo-Z inputs, a signal strength bar-graph indication automatically appears and you must select one of two input ranges:

10MHz - 200MHz (3 stage amp)
10MHz - 2400MHz (2 stage amp, divide by 64 prescaler)

The M1's 50 ohm input covers the entire range 10-2400 MHz, whereas the 3000A allows selection of 10-220 MHz or 10-800 MHz on the A input and provides 500-3000 MHz on the B input. The M1 has slightly less advertised sensitivity (blank entries imply no published specification):

MHz	M1	3000A
10	5 mV	5 mV
150	0.3 mV	0.3 mV
200	0.45 mV	
400	0.6 mV	
800	3 mV	3 mV
1000	10 mV	1 mV
2000	5 mV	
2400	50 mV	
3000	60 mV	

The M1 bargraph has a full scale reading of 10-20 mV, whereas the 3000A has a full scale reading of 2-4 mV (dependent on frequency in both cases). It has ten RF bandwidth/display resolution combinations (same as the 3000A), but because it has only two RF ranges, each range has more gate time selections. I *still* don't understand what the sense is providing more than 6 digits of resolution with a 1ppm time base. This misleading "resolution" continues to be an Optoelectronics selling point and is inappropriately echoed by others.

In parallel with all the above input selections, two switches let you operate in either of four modes. I'll call them modes 00, 01, 10, and 11, representing whether FILTER and CAPTURE, respectively, are off (0) or on (1).

00 (FILTER off, CAPTURE off) Operates as described above. This is the single mode of the original Model 3000. Meter shows updated values even if it's counting noise. Gate light blinks continuously.

10 (FILTER on, CAPTURE off) Computer logic looks for meaningful oscillations, providing a new frequency value only if a legitimate

count is acquired. A higher level of filtering can be selected by holding down Button 1 during power up.

11 (FILTER on, CAPTURE on) Same as mode 10 except nothing happens until you arm the system by pressing Button 2. Once you do this, the word "frequency" flashes on the display until a legitimate count is snagged. A three-memory buffer (the display plus two more) keeps previous values. They are referred to as X, A, and B. X contains the most recent, A the second most recent, and B the third most recent. When a fourth value is snagged, the value in B is lost.

01 (FILTER off, CAPTURE on) In this mode, no measurements are taken. Button 2 rotates between the three memories recorded in mode 11.

>>> PRODUCT SUPPORT
Optoelectronics employees are professional and are helpful on the business end of things. Raw technical knowledge and, thus, the ability to help diagnose problems or give application suggestions is, in my experience, limited to only one person. See the 3000A product review for details of my experiences.

>>> REAL LIFE
I have two regimes of interest for which I want this counter. The first is modem and ultrasonic work in the KHz to 100KHz range. The second is radio VFO work, requiring MHz up to GHz. I characterized the M1 with a 20 Hz - 1 MHz Heath EUW-27 function generator, my Yaesu 757GX/Vectronics VC300DLP combo, an ADD8000 analog/digital prototype station, a Fluke 8000A DVM, and a Solaritron CD1400 oscilloscope.

--- low frequency ---
For the less than 10MHz work, the Hi-Z inputs must be used. I have a 2 MHz TXCO standard in my shack that has an output floating on the back side of a little toroid transformer. It gives out approximately +-0.8v with an output resistance of 100 ohms. The 2 MHz output shows up as a stable 1.999947 MHz on the M1. The waveform was not symmetric, but it was very stable and clean from other high frequency hash. It looked sort of like this:

```
-. .---. The waveform stayed the same regardless of
| | | whether the M1 was hooked up. The M1
| --. | -- counted the same regardless of whether the
./ ./ o'scope was hooked up. P-P voltage was 1.7v.
```

The 1 MHz TTL tap from the TXCO was a square wave ranging between 0 and 3.8 volts. Regardless of the M1 filter selection, it showed a stable frequency of 0.999974 MHz. These tests came out MUCH better using the M1 than the 3000A.

I next fired up the Heath variable frequency / variable amplitude function generator. I needed large amplitudes--WAY above the specified 10-20 mV. The procedure used was to start at about 1 V and decrease the voltage. If a stable count held, I reduced the PP voltage until spuratic

readings were obtained. The resultant measured PP voltages (asterisks indicate I never was able to get a good count):

Frequency sine square
--------- -------- --------
20 Hz * 35 mV
200 Hz 2.7 V 12 mV
60 KHz 1.8 V 15 mV
500 KHz 70 mV 20 mV

In all cases, the scope showed clean signals with no high frequency hash. For the two lowest frequency square wave measurements, hand placement while adjusting the voltage level significantly affected the required amplitude. Best (lowest) voltages are reported above.

The results for the sine wave signals are about 2x worse than the 3000A Input A response, but incalculably better than the 3000A Input B response. The M1 responded well to square waves whereas the 3000A did not.

I own a PK232 radio modem and decided to see if the meter was good enough to tune the audio tones. With nominal output from the PK232 (130mV RMS on the Fluke, good to 10KHz), I measured the tones with the default digital filtering of the M1 engaged. The 2200Hz tone showed as 2272+-1, the 1200 Hz tone showed as 1278+-9 (14 samples each, standard deviation reported).

--- high frequency ---
My RF test goal was simple. How reliable is measurement of my 757GX VFO? Working at 15 MHz, the Lo-Z input (only one suitable for this measurement) has an advertised sensitivity of 5 mV. I used a scanner antenna, supported about and inch away from a resistor I used as a load. The counter's bargraph was about 3/4 scale deflection from the ambient noise. The transmitter's VFO was allowed to stabilize or about half and hour and then brought to within 5 Hz of WWV's 15 MHz carrier. Transmitting 25 watts into the dummy load resistor, the counter hit full scale bargraph and displayed a frequency of 15.012 MHz. At 100 watts, the M1 displayed 15.001 MHz. Accuracy doesn't look so good under reasonable ham shack conditions, but the M1's 50 ohm input is at least usable whereas the 3000A's was not under similar circumstances.

>>> OPTIONS
You can buy a precision (0.2ppm vs 1.0ppm) timebase for an extra $100. Again, I stayed away from the 0.2 ppm precision timebase because specified aging would quickly degrade me back to the standard 1.0 ppm timebase. Additionally, I don't often need to know the last 2 Hz on a 10000000 Hz signal. As with the 3000A, the electroluminescent backlight is no longer an option-- the standard price is just higher.

>>> GOTCHAS
The serial interface is unidirectional. You send it a CR and it sends back 10 digits and a decimal point, in ASCII, 4800bps, 8 bits, no parity, 1 stop bit. It provides only the most recent number, with no indication

of whether this is another sample or the same number it just sent you after your last request. The interface can sink 1.6mA and source 0.06 mA.

Excellent amplifier sensitivity isn't everything. For decent counting, the signal you're monitoring must exceed the noise (combination of *all* other RF signals in the bandpass of the selected amp) floor by a claimed 10-15 dB. Specified sensitivity ranges from -57dBm to -13dBm. The input amp is limited to +15dBm. Ambient noise, including FM stations hovers about 3/4 scale on the bargraph when using an AR100XLT scanner antenna. Since the scale goes from -56 to -26 dBm, that's roughly a -33 dBm noise floor. Adding in the 15 dB overhead for a good measurement gives -18 dBm required signal. That would be 8 dBm above full scale, roughly 3 bar segments. This matches real life experience of the Yaesu 757GX related above.

The Hi-Z M1 input handles square waves better than sinusoids, whereas the 3000A showed terrible susceptibility to harmonic lock-on with non-sinusoidal waveforms -- both for me and the other friend spoken of above. He was trying to measure a frequency multiplying class C VFO and confusion as to which stage was being measured made the meter unusable. On another project, anywhere near a 50 KHz switching power supply, measurements were dominated by it. He asks "would I have this problem with a TEK or HP counter?" I don't know. I know my extensive experience with a 7226B counter in the 1 to 10 MHz range showed none of the bizarre behavior seen with this (and the 3000A) high sensitivity counter. Triggering of these counters is just erratic. Perhaps a DC trigger with variable threshold adjustment would be better. OE's digital filtering DOES help, but often the filter is fooled or else specified sensitivity is unattainable.

In Damien's review, he emphasizes the importance of a limited bandwidth antenna. Take this recommendation seriously. The M1's bargraph covers the range of real-life, on-the-air signals much better; it actually moves around rather than being saturated most of the time. The required 10-15 dB spread between noise and desired signal appears as 3 to 4 bargraph segments on the 16-segment display. The 3000A and the M1 appear to be optimized to do off-the-air measurements. In this role, using the M1, I've had fun snagging frequencies used by all sorts of Air Force base agencies in a manner just as Damien described. In the lab, using hard-wire connections, the Hi-Z inputs of the M1 don't measure up to specs and the 3000A inputs seem downright unusable.

>>> SUMMARY
Paying $100 less for a M1 balances against having only one input and loosing the extra modes of operation. Because these extra modes relied on the unreliable Hi-Z inputs, I don't miss them. I am extremely interested in hearing reports from others in the field that have success or failure with the M1 and 3000A Hi-Z inputs.

All models are available only direct from the manufacturer in Florida. Contact Optoelectronics: 5821 NE 14th Avenue, Ft Lauderdale, FL 33334.

To discourage pecuniary interests, Copyright (c) 1994 Brian Mork

>>> ADMIN
The MLHacker series is formatted to print out on 8.5"x11" sheets manually fed into an Epson LQ-850. I print at 8 lpi, which gives 82 lines per page. Back issues are available from ftp.cs.buffalo.edu in the \pub\msdos\ham-radio directory. E-mail server ham-server@grafex.cupertino.ca.us also has them in the directory \hamradio\newsletters. Note in the signature block that my packet radio address has changed.

>>> ALTERNATE BATTERY SOURCE
In April Jim forwarded me results of his efforts to modify 9.6 volt Makita power tool batteries. Cut directly from his Internet message, here are his observations (thanks Jim!):

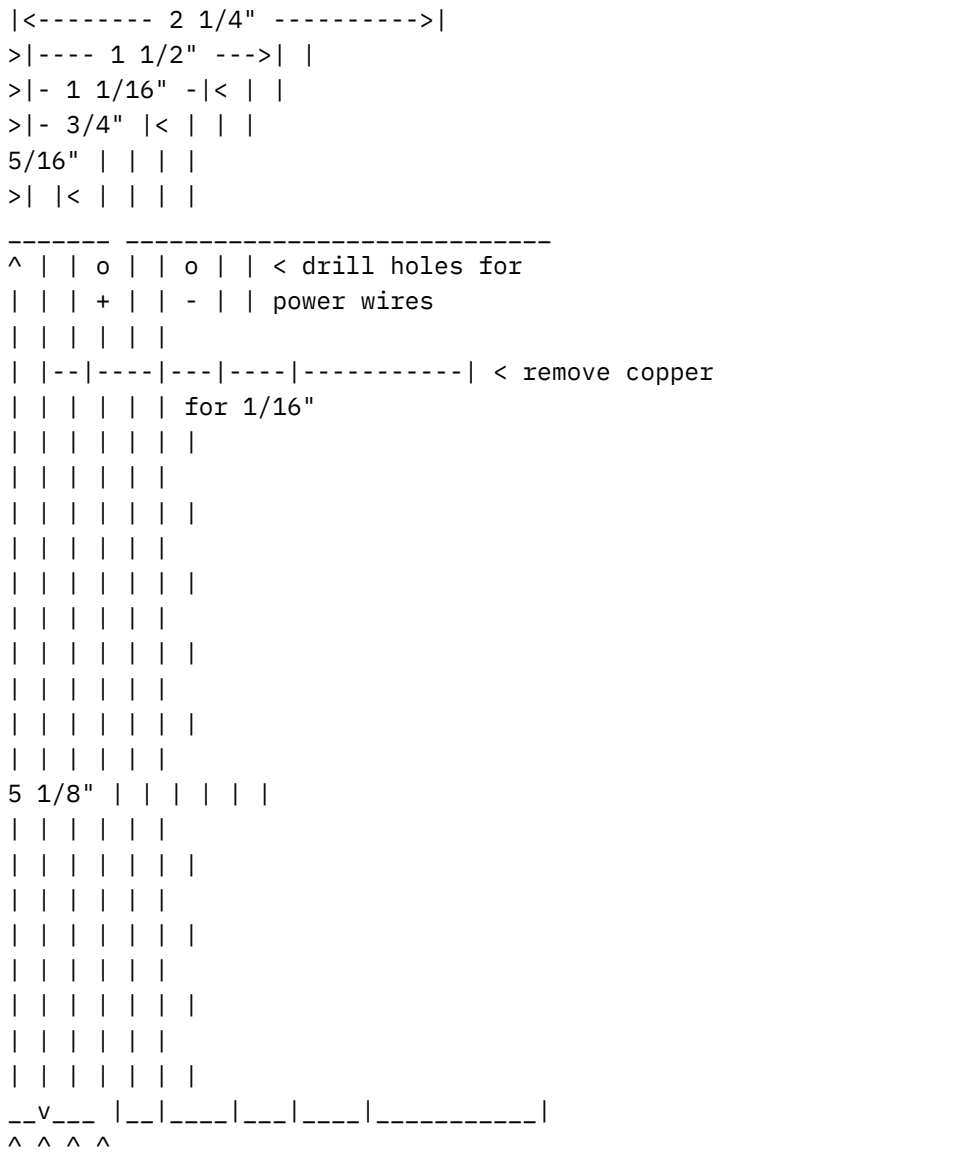
"Just the other day I did something I've been dreading for 6 months. I removed the stock battery from my Zenith ZL-2 Minisport and connected a variable voltage power supply directly to the computer's power terminals. After adjusting the supply to six volts, I powered up the computer and verified that it was working properly. Then, taking a deep breath, I slowly cranked the power up to ten volts. No explosions, no complaints from the Minisport power supplies, It took it just fine. Great, now I can use my 9.6 volt Makita batteries with the laptop as part of my portable packet station.

"Since the internal Zenith supplies are all switchers, current drain is inversely proportional to battery voltage. This means no power is wasted regardless of whether the voltage is 6.0 (stock Minisport battery) or 9.6 volts (as in my Makita pack). I measure 450 - 650 Ma drain with a 6.0 volt source (depending on backlight brightness), but with a 9.6 volt source, only 340 - 425 Ma is needed. The Makita batteries are about 1400 MAh capacity and run my ZL-2 for 3 hours with the backlight on full. Obviously, a 7.2 volt external would work also, with proportionally reduced operating time.

"I had to make a better way to get the external power to the machine than the alligator clips I was using. I thought I'd share what I built with you all. Here's how to make a fake battery pack for your Minisport.

"Begin by cutting a 2 1/4" by 5 1/8" piece of single sided glass epoxy Printed Circuit board material. Remove 1/16" strips of

copper along five lines as shown in the following diagram.



Remove copper along these four lines

"Drill the two holes close to the edge so solder will not interfere with the power contacts on the machine. Only the two small rectangular areas with holes will actually be energized. Isolating these minimizes the possibility of short circuiting the battery. Nevertheless, you should always disconnect the external battery when the fake unit is removed from the computer.

"You can remove strips of copper by double scoring the material 1/16" apart along the indicated lines, then gouging out the metal with a knife or wood chisel. With some patience, you can also do it with a hacksaw or a hand grinder. My favorite method is using a 1/8" drill bit in a small drill press as a router. I raise the table until the PC board is just touching the drill bit. Then one or two thickness of 3 x 5 card under the board

raises the copper just enough so I can route out metal along the lines by moving the board under the bit while it's turning at the highest speed. I have a piece of wood with a vertical fence screwed to one edge that I can "C" clamp to the drill table to help guide the PC board while routing.

"You will need to solder a power cable directly to the board, or glue some sort of jack on the board to accept a power cable through the battery cover hole. The NEGATIVE terminal is nearest the front of the Laptop. The POSITIVE terminal is the rearmost. You won't need a connection to the center terminal, it is used by the Minisport charging circuit. Use a minimum amount of solder and file the solder bumps down smooth.

"Complete the fake battery by gluing a block of wood about 1 inch high to the glass side of the PC board. This takes up the slack in the battery compartment so the board is pressed firmly onto the computer's power terminals. You will have to sand the block to just the right height, or glue on strips of cardboard for extra height if it's too short.

"One problem with using a higher than six volt battery with the Minisport is that the low battery voltage alarm doesn't work. It appears that by the time the 9.6 volt pack is discharged far enough to trip the alarm, it's going down so fast that there isn't time for an indication. Save your work often if you're near drop out time. It should be possible to construct a separate discharge alarm on the fake battery board that will trip at a higher voltage and give a couple of minutes warning.

"I have also created a real battery pack for my Minisport by using one of these routed out PC boards, and hot gluing five "C" size nicads to the top. It works as well as the 1700 MAh Minisport batteries but I have not figured out a way to use the Minisport charger. Also the exposed battery power terminals on the bottom require care to avoid short circuits.

>>> DRIVE EXPANSION PINOUT
On the back of the Minisport is a small plug with a rectangular external form and an internal "D" shape. I have been unable to identify a source for this connector, but several people have asked for the pinout. Here it is, compliments of wa8wzx. The top row of pins 1 through 19 are all sequential odd numbers. The bottom row has pins 2 through 20. Pins 4, 10, 12, 19 & 20 are all ground. Others are:

1 Disk Change 2 Side Select 3 Read Data
5 Write Protect 6 Track 0 7 Index
8 Write Enable 9 Write Data 11 Step

I'm thinking about building a small amplifier for a 2m HT to use
in my car. 30 or so watts.

Anybody know where I could get some plans?

What's inside a General Radio RF bridge?

I'm about to embark on homebrewing an RF bridge. I've looked over a few ARRL Handbook designs, and the one in the ARRL antenna book vol 3. But I'm wondering if I couldn't do better by emulating GR and re-zeroing the bridge at every frequency change, rather than attempting to null the bridge over the full 2 to 30 Mhz range. I'm also curious about the design of GR's bridges. (I've never used one.)

Thanks,
-Steve

If you can lay hands on the Motorola RF Device Data Book, Vol II,
there is an excellent design by Helge Granberg for a ~30W amp in app note
AN791. Its based on the MRF240. There is also one for ~75W using the
MRF247.

A source for the Databooks, and the devices, is RF Parts, San Marcos Ca,

>
>
Lousy description of "isolated circuit" on my part:

The ground and neutral on the "dedicated circuit" IS (must be) terminated inside the circuit breaker box in the basement in the normal, NEC-specified manner. This prevents ground loops. It also is the only set of hot, ground, and neutral in an independent cable run from the distribution box to the outlet. There are NO other devices in the circuit save the outlet at the computer location. This prevents other equipment from injecting noise into the circuit, unless they can "move" the ground and/or neutral in the distribution box. I woulda run it all in metallic conduit if I was really out for noise reduction, but my surge supressor/filter seems to solve the RF noise problem.

If I really needed a pseudo-isolated ground, I woulda run the circuits into a separate distribution box. In some juristictions, these boxes may have a separate ground lead to an earth ground. (not here, though). "High Isolation" transformers could be necessary, too. For my tube-type Ham radio stuff, I may have to run through a "ground window" that is connected to a good RF and electrical ground point for antennas, computers, and radios. Keeping RF outta the house is a whole different ballgame. I'm trying to keep pulse-type noise out of the computers, at present. RF adds a whole new set of problems! My HAM shack may have to be run in conduit to keep the RF out of the power (and my hide, if you know what I mean).

Power distribution is such fun (NOT!)

: Does anyone know a circuit for a crystal controlled receiver which has a
: crystal whose frequency is the one you are receiving, not plus IF?
: I think some cheap toy walkytalkys might have such a circuit and it should
: only need 2 or 3 transistors.

The crystal in most walkie-talkies is used during transmit, and there is no crystal in the receive circuit, because it would be too narrow band.

You didn't say what kind of modulation you wanted, or what freq. And it isn't apparent why you would want to use an IF of zero Hertz. If you use a crystal in a LO to generate a freq close to the received freq, you could use a PLL for the FM detector, where the difference could be under a hundred KHz, maybe.

As far as I've seen, all circuits that were built to save on transistors were back in the 50's and early 60's. Everything since has not had the need to, since a transistor only costs a dime in quantities. Cheap toy walkie-talkies are just that: toys. They have little or no range, and they have a regenerative receiver that puts out more power than it picks up. A joke.

Circuits start out as a means to an end: to accomplish something. If you want to do something well, then determine what you want to do and build the circuit to do it. Try not to compromise to save a transistor.

The more IF stages you have, the narrower the bandwidth, and that's really necessary in today's crowded bands.

2031. RE: 1750 meter band

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-01 22:12:48 UTC
From: srghsjm@grv.grace.cri.nz
Message-ID: <31js0s$3h3@zephyr.grace.cri.nz>
Source record: 116770

There is LF activity in other places around the world other than the USA. Herb Balfour's activity in Canada has been mentioned.

Australia has had quite a long history of amateur-like activity in this band for many many years, although access to the band is provided by way of Australian experimental licenses. They have generally used about 190kHz, and various experiments have seen signals from Victoria in the East heard as far away as Western Australia and New Zealand (and that's a long way away).

New Zealand radio amateurs have the use of part of the LF spectrum, where they can use their own callsigns. This is not an amateur band as such, and does not appear on the amateur allocation chart in this country, but it is a "designated use" of amateurs here. The conditions are fairly simple, and are as follows (drawing from memory):

(1) Open to general grade licencees (there are two grades in New Zealand - General and Limited. The difference is that the Limited license does not need a morse pass, and is restricted to 6 metres and above).

(2) Operation is allowed after one has requested, and received, a permit from the administration (the Ministry of Commerce). This is not onerous, and the letter received just outlines the conditions here.

(3) Maximum power 5 watts EIRP. There are no feedline or antenna restrictions.

(4) Operation is between 165 and 190 kHz, although most activity settles around 180 kHz.

(5) Operation is on a non-interference basis, and amateurs have to tolerate interference. Chiefly the interference is power line carriers, but there are other sources from overseas.

(6) Operation is on an "until further notice" basis. In reality I can't see any amazing rush of users for this band so this is not likely to be a major problem.

I understand that French amateurs have considered trying to argue for a few bands in the LF area, at least one proposal of which was around 48kHz. LF operation is bound to be difficult in Europe due to the proliferation of the broadcasting service.

Papua New Guinea is also another country where I understand a few amateurs want to start experimentation using the New Zealand or

Australian type of rules, but I don't have an update.

Maybe there are other countries interested too.

Joe Miller (jmiller@peds.eyes.arizona.edu) wrote:
: Once upon a time, there was a great "technical"
ham radio mag called "Ham Radio".
: It was apparently too technical for the market,
but had a great run and I still access back issues.

Ham Radio failed because there wasn't enough to
publish. This may be partly due to the publisher
at the time--he may not had the talent needed to
convince technical types to spend time writing up
their latest creations.

A secondary problem is the parts used. The cheapest
parts these days isn't surplus--its samples from
manufacturers. They usually work pretty good too--why
would they bother sending out grade-outs as samples to
convince people to use their products? Of course, not
all these neat and nifty products actually sell--so you
have parts that really *are* unobtainable.

There is also the temptation to use parts in your junkbox
that that are absolutely *perfect* for the application.
For instance, a quarter wavelength of 32 ohm coax was
used in my latest 2 meter beam--I wanted to keep it as
light as possible (2 mile hike with 1700 ft elevation
gain, with 2M SSB/CW/FM, 10 GHz SSB/CW/FM gear). By coiling it
an placing it in the boom (waveguide below cutoff), it works
as a very lightweight balun (instead of heavy ferrite beads).

I have had serious problems with the Chinese power grid tubes, and would
tell you to avoid them if at all possible. However, I will also recommend
the Svetlana tubes from Russia, which are similarly priced and of the
same quality as their Eimac equivalents. I have been very happy with the
Svetlana products.

: >Just wondering,
: >Galen, KF0YJ

: Sure, you can use PIN diode switches instead of relays. *Matched* 100
: watt switches are practical. However, to emulate the double pole double
: throw relays used to switch an inline amp is a bit more complicated than
: just doing a TR switch. If you don't need the switching speed, the relays
: remain simpler and cheaper.

: Your switching bias has to be stronger than the RF signal in order to
: keep a diode switch in the OFF state. That becomes a bit challenging
: at the 100 watt level where the RF voltage can be 70.7 V RMS with
: unity SWR. If SWR rises, the voltage needed can become ridiculous.

Incorrect. At zero or reverse bias the diodes act as small capacitors, rather than diodes, to the RF signal. Properly used, the device is too slow to act as a diode to the RF. Thus, it isn't unusual for a 100 watt switch to run of 12 volts. Page 34-6, 1988 ARRL Handbook is an HF example. But, you do have a breakdown voltage to contend with. When you start shorting out parts of your matching network (arcing), it is entirely possible to develop unusually high voltages (inductors like to keep the current constant, even if it means developing many kilovolts). This is what can kill diodes.

Most people look at charge/current models when designing PIN diode switches. They work fine till you run out of charge in the intrinsic region. I've not seen someone try to teach this from a voltage bias standpoint, though I suppose anything is possible with enough work :-). You do want to explain why PIN diodes don't work as well at lower frequencies--or why you need more current there for a given power level.

At VHF and high power, the small capacitors can be a problem in that enough isolation can be difficult to get. You can add quarter wave line sections and shunt elements, but the circuitry gets complex. Loss may also be a problem--do you want another 0.2 or 0.3 dB of loss ahead of your preamp? Reliability is another problem--how do you insure that one minor problem doesn't destroy everything? Relays inherantly isolate two ports--unless you wire it up wrong. Trying to interlock PIN diodes isn't easy--I've not seen much in the way of failsafe circuits to copy.

My Motorola manual generally lists _higher_ heat dissipating ability
for plastic than for metal without a heat sink, although naturally,
metal is what you want if you are going to put a heat sink on it.

Hello all -

I am building a project which requires a 455khz xtal for a
Beat Frequency Oscillator (BFO). I've already checked mouser,
digikey, dc electronics, all electronics, cw crystals, and also the jan
catalog (nothing that low in freq). I need this xtal!

Background on the project: it's a SSB generator, and yes, I have
entertained the idea of using a different IF, one that uses easier
to find parts! But I want to build the first one per the original
design, then make changes in the successive versions. Besides, I
have all the other parts (i.e. 455khz filter) and this part is
standing between me and SSB!

Any help appreciated.

Check with Surplus Sales of Nebraska (address/phone in QST, CQ, etc.)
They support old Collins gear which has, tada, a 455KHz IF. Tend to be a bit pricey but stuff is in good condx and the service has been excellent when I've purchased from them.

Fortunately, the _clock_ is about as RF-friendly as a digital gadget
is going to get: it counts the 60Hz line, and drives small incandescent
lamps without multiplexing. The chimes seem to be the culprit here. I'll
bypass the AC lines as you suggest, but I'm very curious as to the source
of the frequency modulation. There's almost no AM on this radiated signal,
and the FM is very high quality :-/.

The plastic ones usually aren't specified for as severe environmental conditions as metal ones. Plastic transistors are regarded to have a higher failure rate under conditions of extremely high temperature and humidity. In general, this is of interest only to designers of military-type equipment; for the rest of us, plastic is just fine.

(It's easy to see why transistors have a maximum temperature rating. But didn't you ever wonder why there's a minimum, too? Why, it's because if they get too cold, they freeze their cans . . .)

My recollection is that the 2N5179 is a four terminal transistor, with the forth lead connected to the case. It is a UHF transistor, with fte of 1.8GHz or so, and it may be of help in some circuits to be able to ground the metal case. I'm surprised that a plastic '5179 is available.

Get a series resonant 5 MHz. crystal. However, put a 220 uH. inductor
across it to resonate out the holder capacitance. Then put a 4.7 pF.
capacitor in series with the capacitor/inductor combination to make it
oscillate in extreme parallel mode. This will shift the frequency up
about .1% to 5.005 MHz. Divide that frequency by 11 with
a 74HC161 and you get 455 kHz. You could also use 10, 15, or 20 MHz.
and divide by 22, 33, or 44 respectively.

5, 10, 15, and 20 MHz. xtals are available everywhere. Most are parallel
resonant, so you'll have to specifically ask for series resonance
(unless you can get by with your BFO being at 454.45 kHz. instead of 455
kHz.).

gdian22@rfc.comm.harris.com (Gary M Diana) writes:

> [needs 455 kHz BFO crystal]

Yes, this is getting a bit low for fundamental AT-cut crystals, but manufacturers can certainly supply crystal resonators at 455 kHz: check with ICM or Piezo. Some cuts have useful modes at sub-kHz.

You might also consider a ceramic resonator; I think Digi-Key carries these (from muRata or Toko). The technology is the same as the ceramic filters you mention. Lower Q, thus higher phase noise. Also, you can divide down from a crystal source at, say, 4.55 MHz. (Diode mixers like the nice square waveform, but this is nothing to get excited about for a BFO application.) Finally, if you want to cobble up something quick, don't overlook a simple LC oscillator, which can be quite stable.

Source record: 116789

Moulded plastic or metal can? As with most things in life, it
depends...

Plastic and metal mostly use identical dies/bonding wires. This means
that peak current capability and voltage breakdown levels are usually
the same (check the data sheets!) or only slightly lower.

Thus for low duty cycle use, plastic can often be used in place of the
metal packaged version, resulting in a reduction of board size (TO-220
instead of TO-3), as well as weight (portable gear).

In really low duty applications, you may be able to use TO-220-
Isolated, which does away with things like mica isolating washers and
heat conducting paste.

Needless to say, moulded plastic transistors are cheaper, important if
you are designing for large volume production, or if you are on a
tight budget :-)

Does anyone know if nasties like BeO are used in plastic 'exploding'
packs? If so, a good reason to use metal for prototyping.

Hope this helps.

Cheers,

Wilbert (ZL2BSJ)

As a club project, we built the 2-m amp described in 73 a few months back. It uses one Motorola MRF1946 transistor.

The design is very easy to duplicate. You can make the circuit board using masking tape an an X-acto knife. Don't bother adding the relay-compensation capacitor, it's a waste of time.

This was the first time some of the club members ever picked up a soldering iron, yet every one of them worked first time (barring a few wiring errors!)

Cost of parts was about $35, excluding a box to put the thing in and a heat-sink.

2055. Periodic Announcement - ARRL Email Information Server (info@arrl.org)

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-03 03:00:03 UTC
From: mtracy@arrl.org
Message-ID: <rec.radio.info-arrl.email.info_775882802@ve6mgs.ampr.ab.ca>
Source record: 116912
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew,rec.radio.info

Periodic Announcement - ARRL Email Information Server (info@arrl.org)

The services that the ARRL provides via the internet include the
Email Information Server and the Technical Information Service.
The Information Server is an automated mail server that gives you
access to many of information files relating to various facets of
Amateur Radio. You can retrieve any or all of these files by
sending an email message to info@arrl.org here at ARRL HQ.
Each file you request is then mailed to you automatically.

To use it, mail messages to:

info@arrl.org

Each line of the message body should contain a command as shown below.
The subject of your message is not processed and may be omitted. You
may place as many commands in a message as you want. The files you
request will be sent to you in separate messages. Only ASCII text
files are supported.

Valid INFO commands:

reply <address> (may be needed - see below for explanation)
help
index
send FILENAME (example: send prospect.txt)
quit

In the above message example, "help" retrieves a brief set of
instructions for info, "index" retrieves a list of available files
and "send prospect.txt" retrieves a text file containing information
on becoming a radio amateur.

Note to users with FTP capability: All of these files are also
available by anonymous ftp to oak.oakland.edu in the
pub/hamradio/arrl/infoserver area. Retrieve the file index.txt
in the /league sub-directory for a complete listing of available
files.

If you want to retrieve several text files with one message, use a
separate line for each "send filename" request.

Your From: field or Reply-to: field in your header should contain a
valid Internet address, including full domain name. If your From:
field does not contain a valid Internet address, the answer will not
reach you. If this is the case, then use the reply command as shown

above. When needed, this command should always be the first command in your message.

IMPORTANT: Please use the quit command in your message. This will prevent processing errors from message signatures.

PLEASE NOTE!: This is an automated system not capable of handling written requests. Any questions on the info-server or the content of any of its files should be directed to mtracy@arrl.org.

ALSO NOTE!: Do *NOT* reply to messages sent from info@arrl.org - the reply address is redirected to keep bounced messages from endlessly looping. Write a new message to info@arrl.org instead.

The Technical Information Service gives League members on the internet better access to the knowledgeable technical staff here at ARRL HQ. Questions relating to Amateur Radio and related technical topics are welcome. To use this service, send a normal e-mail message to tis@arrl.org with your question spelled out in plain english. For best service, be as specific as possible and keep your line length in messages to a maximum of 80 characters. Due to personnel limitations, priority will be given to questions from League members.

Best Regards,

Michael Tracy, KC1SX, ARRL Technical Information Services Coordinator
(e-mail mtracy@arrl.org)

Sample of files available from INFO: (There are lots more!)

Note - If you are not yet an Amateur Radio operator retrieve the file prospect (send prospect) for information on how to easily get started in this fun hobby.

I need a schematic for a small, vacuum tube 6m amplifier... I'd like it to be in the area of 10 watts... nothing fancy, just a n amplifier I can make for cheap. Thanks.

2059. Search: 12V to 30V 2A DC-converter circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-03 09:45:51 UTC
From: MKERP@canberra.rz.fh-offenburg.de
Message-ID: <MKERP.27.775907151@canberra.rz.fh-offenburg.de>
Source record: 116797

Hello!
My 2m V-MOS driver stage (about 20W output) needs 30V, max. 2A. Because the transverter, where the driver will be placed, operates with 12V, I need a DC-DC-converter.
Now I am searching a proper working circuit (not to expensive) with following specs:
DC-input: 11-15V (battery operation, voltage can change)
DC-output: 30V, 2A (continous), short-circuit protection or current limiting would be a good feature

Perhaps the LT1070 from Linear Technology will work, do you have any applications?
Please Mail to m.kerp@fh-offenburg.de or mail-adress listed in the header.

Excuse my bad english, 73 Mike (PR: DL1GNM@DB0FRB.DEU.EU)

2060. Xtal application (series/parallel)

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-03 10:48:19 UTC
From: randolph@est.enet.dec.com
Message-ID: <31ob13$e3e@mrnews.mro.dec.com>
Source record: 116803

Newby at oscillator design asks:

I recently picked up a couple of random 10 MHz crystals at a flea. I've been attempting to use these in a simple little crystal calibrator circuit. The problem is that it oscillates a little too fast, around 10.002-10.005 MHz, depending on what I have for capacitance in the circuit. It seems that putting enough capacitance in to get the frequency down to 10.000 kills the oscillation. Ckt is a Pierce oscillator, if it matters.

I assume what I have here is a series resonant crystal...? How do you apply these... put some inductance across it to resonate out the capacitance?

I haven't been able to find much discussion of this in print...

-Tom R. N1OOQ randolph@est.enet.dec.com

2063. Re: Source for Crystals

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-03 15:04:08 UTC
From: gdian22@rfc.comm.harris.com
Message-ID: <CtysIx.K2q@news.ess.harris.com>
Source record: 116809

Hello all -

About the 455khz crystals...

1. The circuit design really calls for resonators. I saw the
symbol for xtal and took off shopping for the part. Turns
out Digikey has a 455khz resonator, for about a buck each.

2. I received about 10 replies, 70% said to go the resonator
route, the other 30% described various methods of obtaining
455khz by dividing higher freq xtals.

I replied via email to everyone I heard from... if I missed you, my
apologies. I appreciate the help/info, I learned something new
here. When I get the parts (probably next week) and get this project
going, I'll report back as to it's operation.

73 for now. Gary N2JGU

2064. Repeater for sale

Newsgroup: rec.radio.amateur.homebrew

I have the following for sale:

Regency UHF Repeater (estimate 10-15W power)

Data Signal Inc., Autopatch Model RAP 200
Model # RAP 200

Phelps Dodge Communications duplexers (4)

This is commercial grade equipment previously used for a mobile
phone/pager network
running on the 400MHz band. Tx 462 MHz, Rx 467 MHz.

Highest bidder takes it!

Er, uh, (blush), of course you are correct. I was thinking of *switching*
diodes when I wrote that, not PIN diodes. With PINs, the trick is having
enough forward bias current to keep them in the ON state. Ah, well. :-(

>
> Anybody know where I could get some plans?
>--

Try the ARRL Handbook. My 1974 copy has a 25 and 45 watt amp for
2-meters.

Strangely enough, older editions have more useful information.
The new ones cover things that apply to every-ham, like 45 foot
dish antennas mounted on navy surplus gun mounts. Or really
useful things that can't be found anywhere else, like ASCII/Baudot
tables and other newfangled computer stuff.

And then there's projects using parts cheaply and easily available
in the 90's. Well, I'm off to the local Radio Shack for some dual-
gate MOSFET's.

Right about being series resonant. However, you want to put the inductance
in *series* with the crystal, start with 10 uH.

>I haven't been able to find much discussion of this in print...

Crystal oscillator design, in my experience, is self taught or learned
from other engineers. Books aren't much help.

>A quibble: It's nominally 32 pages long.

A quibble-quibble: about 4 of the internal pages are advertisments which
seem to already be in QST. :-)

However, I really prefer that the ARRL keeps QEX a separate publication.
As a special interest publication, its editorial board can cater to the
needs of the technical readers rather than succumb to more general pressure.
The recent "How technical is 'too technical'" question posed by Jon Bloom
and what he did in response to the survey is a good example of that.

2076. My el-cheapo VHF swr meter

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-04 00:38:14 UTC
From: sbertsch@magnus.acs.ohio-state.edu
Message-ID: <31pd9m$af6@charm.magnus.acs.ohio-state.edu>
Source record: 116808
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

In the recent past I posted a question - how do I make a cheap VHF swr meter? Well, I got lots of helpful replies (thanks to all!); most of these involved either 1) a PCB microstripline, or 2) the pickup loop under the coax trick. I started building no.2, but then...

Last weekend I was at the local ham radio emporium, when I espied a used RS swr meter, the real cheap one they sell for CB's. For $9, I figured, it's at least good to strip the meter out of. So I take the thing home, and hook it up to my 2 meter HT and a precision 50 ohm coaxial termination. The thing says 1.1:1. Then I try a 100 ohm load - damn close to 2:1. It must be working! Next, I reverse the connections; not so good, around 1.7:1 with 50 ohms. Sensitivity: with my HT @ 146MHz and 1W output, I could peg the meter with the wiper on the CAL pot about 40% from the ground end. Not bad.

Taking the thing apart, I discover a PCB stripline with 2 pickup loops, and a pair of detector circuits. The reverse loop is terminated with a trimpot, but the forward loop ends in a fixed 100 ohm resistor. Time to re-engineer the thing. Here's how...

1) Add a 1K trimpot across the 100 ohm loop termination. 49 cents at RS. Just stick it on the foil side of the board. The actual loop impedence measures 86 ohms at null.
2) The forward detector circuit has a 270 ohm resistor between the diode and the FOR/REF switch, the reverse circuit does not. This is isolation for the "field strength meter" circuit. Add another resistor to make both sides the same - there are already pads on the board for this.
3) Cut out the two diodes for the "field strength meter" circuit. It doesn't work anyway, unless you clip-lead the thing to your antenna.
4) Check the forward drop of the two detector diodes - if they're too far apart, replace them with a matched pair of 1N34A's.
5) Null the loops with a *good* quality 50 ohm termination.

That's it. For less than 10 bucks I've got a pretty good 2 meter swr meter. Even if you buy one new for $19.95, it's probably cheaper than anything else you'll find. Make sure you get the cheapo model, with the worthless field strength meter circuit; I have no idea what's inside the higher priced one. Mine is model 21-525B; except for cosmetic changes, I suspect the newer ones are the same.

It would be interesting to see if this thing works up at 440MHz, but I don't have any 70cm gear now. Any takers?

Now I can get on with building antennas, which is what I wanted to do in the first place. I'll let you know how the vertically polarized loop yagi turns out...

At first glance this looked like a fairly simple question. I've looked through all my books going right back to the 60's (these include RSGB, ARRL and Bill Orr's H'books, and Jessop's RSGB VHF/UHF H'book). There's not a lot of 50 MHz material at about the 10W power level using tubes is there? (it's all 500 W to 1 kW stuff).

However, my copy of the ARRL VHF H'book for 1972 has a circuit using a 6146 tube as part of a transverter project (page 131). Requires +600 V and -100 V supplies. Looks like it may do the job, as it can be adjusted for linear or class C operation.

Victor, do you have access to back issues of Radio Communications magazine? (the excellent RSGB journal).

Look up Rad Comm Sept '84 where on pages 755-758, Steve Price, G4BWE describes a switched-capacitor filter using the CD4066 quad bilateral switch. I did not build this project, so cannot offer any recommendation, although I believe some of the earlier designs suffered from "aliasing" problems.

Hi Jeff, The SuperMorse manual tells you how to do it with SuperMorse. On most transceivers, all it takes is an NPN transistor and a resistor. But the optoisolator suggested by SuperMorse will keep you out of trouble.

With tongue firmly planted in cheek I say, please note that MCP's (Morse Code Purists) will disown you for generating CW with a machine 'cuz it wusn't dun thut way in thu 20's... glad I'm not thut old. :-)

Good luck and 73, Cecil, KG7BK, OOTC (Not speaking for Intel)

2083. Need info on a RX-only ant tuner...

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-04 14:08:02 UTC
From: ai351@leo.nmc.EDU
Message-ID: <9408041408.AA29021@leo.nmc.edu>
Source record: 116875

There was an article on a QRP antenna tuner in the June 1992 Popular Electronics that should work for you. You'll need a 335 pF tuning capacitor, a 12-position rotary switch, a SPDT center-off toggle, a T130-6 toroid (yellow core), and some #24 enamel-coated wire. Wind 21 turns of the wire onto the toroid, making loops for taps at turns 1,3,5,7,9,11,13,15,17,and 19. Solder turn 21 to the first contact (assuming clockwise rotation) on the switch, turn 19 to the second contact, etc., until turn 0 is connected to contact 12 on the switch. Connect turn 0 to one contact of the SPDT toggle, and connect the center of the rotary switch to the other contact. Connect the 335 pF capacitor to the center contact of the toggle, and connect the other end of the capacitor to circuit ground. Now connect the center pin of the transmitter connector to one contact of the toggle, and the antenna connector to the other. The switch lets you electrically reverse the tuner, and by putting the switch in its center position, the tuner is taken out of the circuit.
Here's a rough diagram (with the coil and rotary switch omitted):

```
to center^ ^to turn 0 (contact
of rotary| |12 of rotary switch)
switch | |
+--------------o o--------------+
| / |
| o |
| | |
| C1 (335 pF |
| | tuning cap) |

Those who enjoyed "Ham Radio" might also enjoy "Communications Quarterly."

Although published by the same folks who brings you the CQ Magazine, it
is nowhere like the CQ magazine, both in content and technical calibre.
CQ brought out CommQuarterly after buying out "Ham Radio."

I don't have a recent issue here at work, but have the Spring 1991 issue
handy. Its table of contents (total of 112 pages) will give you a taste
of the quarterly:

. The Quad Antenna: rectangular and square loops
. DSP: Image Processing
. Solid-state 75S-3 Receiver
. VLF-LF and the Loop Aerial
. A 4800-baud modem daughter-bord for packet TNC
. HF modems for data transmission
. Yagi Optimisation and Observations on Frequency
offset and Element taper problems
. What's the Electromagnetic Capability of your antenna?
. The Travelling-Wave amplifier
. A high performance 1296-MHz converter.

Every issue has more or less this flavour. Milage varies from
issue to isse, of course, but the editor deserves much praise for
putting out pretty well balanced issues.

The phone number they gave is: (516) 681-2922. Not inexpensive: $29.95
for one year (remember, only 4 issues) to U.S. subscribers; but as some
TV commercial goes, "you're worth it." I have seen it on newsstands too
(Printer's, Inc. in the S.F. Bay Area, for example).

Disclaimer: I have no connection with any of these magazines, except
that I subscribe to more of them than I should have :-) So, who else
is schizo enough to subscribe to both Comm Quarterly and the DX magazine?
:-) Anyone interested in finding out about the RTTY Digital Journal? :-)

Happy reading and building and 73,

Source record: 116894

I have three coax relays that I am no longer using. All are milled out
of solid metal and plated with relays bolted right to the block.
Two relays are 2-pole switches and the other is a 6-pole switch.
The 2-pole switches appear similar to what Surplus Sales
of Nebraska (402-346-4750) sells for $38+$4s/h. See the picture on
page 40 of the July issue of Nuts & Volts. Theirs are spec'd at 100w,
500MHz, 1 amp contacts, 18-32 vdc coil. The coil on my unit measures 280
ohms static DC resistance. All three relay assemblies I'm selling are in
excellent condition, fully functional. Some relays have diodes installed
across the coil.

1:6 coax relay innards:

A 3" x 2.5" block of metal with a central BNC sticking out of the middle.
On either side are vertical stacks of 3 BNC connectors. On the back are six
relay coils stamped with the text "26 VDC".

Removing an inspection plate shows a brass? copper? bar soldered
directly to the central BNC center pin and held in a milled out channel at the
extemes with teflon spacers. Each relay coil, when energized, lowers a
flexible metal strip onto the bar. The shield of all BNC connectors
are silver soldered directly to the block. All six contacts are normally
open, and close upon relay actuation.

1:2 coax relays:

The other two are identical milled bars (instead of blocks) with similar
central feed and BNCs on the left or right of a center BNC. Construction is
comparable, except on these, one output is normally open, the other is
normally closed.

I advertised the 1:2 relays on the net for $19+$3s/h. If you'd like one
or both relays at that price, pre-paid with a postal money order, let me know.
Any more than two takers and I'll pull e-mail addresses from a hat.
Anybody who offers to prepay more with a postal money order, will get first
dibs. I'll sell the 6-pole switch for $60+3s/h under the same ROE. All
that said, I'll barter.

There was no e-mail address for the person posting this inquiry, so I'll post it here. You can find a good 6146 design in the older ARRL Handbooks circa 1977. These are the old style from before they were 8" by 11". I believe that the design was either in the VHF section or the portable/emergency section. This design should also work with a 2E26 if you only want about 10 Watts. You could also use a 2N6084 power transistor for an inexpensive amp (this is about $13 US for the transistor). There is a schematic for a 2m version class C on page 31-34 of 1985 ARRL Handbook using this transistor. You could scale the inductors and capacitors for use on 6m and add a bias circuit for class AB operation. This transistor can give about 40W of output with about 10db gain at 50MHz. Send me your e-mail address and I should be able to send a postscript file with a schematic in a week or so.

I am working on a power/swr meter project and am in need of some ferrite beads (Amidon FB73-101) and ferrite cores (Amidon T50-3). I am unable to find a vendor for these. Newark, Active and Digikey don't seem to carry it (at least by Amidon) and I don't know the part numbers for other manufacturers.

Why not look into a pair of Advanced Receiver Research's 10GHz gunnplexer based transceivers? Their complete one-channel FM voice or cw units are priced at something near $500, and if you wanted to do some board-level hacking yourself, you could build the modulator/demod-receiver and i.f. stages yourself - the basic gunnplexer with horn is about $190 each...
..they also have units at 24 GHz and higher power (>10mW) units available.

I'd like to find an existing ATV interface for the gunnplexer myself...

Often the plastic package has less capacitance and so might be better at high frequency. The metal can is usually thought to be better environmentally, but since passivation it does not make much difference.

Actually, I am not all that impressed with the general quality
of articles in RF Design magazine. If you've found them
helpful, that's great, but I don't think they're going to
result in large numbers of people becoming proficient in
oscillator design merely by reading them.

As always, your milage may vary.

>tables and other newfangled computer stuff.

In defence of the current Handbook, the editors have a lot more to cover today than they did in 1972 -- or 1965, the earliest Handbook I have. In 1972, nobody was doing data communication, spread-spectrum, computerized logging, digital controls, DDS, AMTOR, etc. Almost nobody was doing EME or satellite communication, weather satellite reception, microwave communication... how many entrants would there have been in a 10 GHz contest in 1972?

The ARRL could have dealt with this in either of two ways. One way is to make the Handbook a lot bigger, so it could go into the same depth on all these subjects as it did HF and VHF in 1972. You know, schematics and such for computers (two or three different processors), modems (two or three different kinds, plus a DSP one with some software), a treatise on programming, a couple of spread-spectrum rigs (one FH and one DS) and maybe a wideband amplifier for SS use, an AMTOR controller, a packet TNC, a couple of microwave amplifiers and exciters, with maybe three for the lower microwave bands plus one for the 47GHz and one for the 120GHz band, a repeater controller (two would be nice: one computer-controlled and one hard-wired), plus all the HF and VHF projects suitably updated to today's techniques. In addition to all the construction projects, they should have sections dealing with satellite tracking, including a couple of computer programs (one for a PC, one for a handheld), a mathematical analysis of spread-spectrum techniques, a full description of pacsat and weather satellite capabilities and communication protocols, information on designing and analyzing microstrip and waveguide circuits, information on adapting TWTs, magnetrons and klystrons to amateur frequencies (with one or two construction projects for illustration), a section on preparation of information for repeater frequency coordination, and so on. The deluxe edition could come with wheels and a little pull-up handle, like a Samsonite.

The other alternative, the one they chose, is to provide at least a few pages on almost everything that any ham could possibly need to know, and

then go into detail on the basics: electrical theory, circuit design, antenna principles (though some say they should do a better job on electromagnetics), operating practices, and construction techniques. If you want more about any of the "esoteric" subjects, there's the Satellite Experimenter's Handbook, the RTTY/AMTOR Companion, the Spread Spectrum Sourcebook, the Microwave Experimenter's Handbook, and so on. ARRL still provides the information and the projects; they just put it in multiple volumes. I think this is a much better idea than a Handbook that weighs 10kg and costs $125.

>And then there's projects using parts cheaply and easily available
>in the 90's. Well, I'm off to the local Radio Shack for some dual-
>gate MOSFET's.

Well, they don't have any dual-gate MOSFETs, but they have a single-gate MOSFET. Maybe you could put two in series. :-)

This is indeed a HP "house marked" IC. Somewhere there is a database
that will cross reference an 18xx number to the industry number.

I also remember (before I became a unix hack) there was a "parts ID"
phone number that could help in cases.

I will see if I can get any info on this. (May be a long shot, though)

Buy these directly from Amidon. They'll sell to hams in small quantities.

I don't have their address or phone number handy, but they advertise in the ham magazines.

Polomar Engineers also carries them, or equivalants. They advertise in the ham magazines also.

Amidon does mail order and has no problem with small orders. Their
phone number is 310-763-5770 and FAX is 310-763-2250. The T50-3 is
$0.65 each and FB73-101s are $2.00 a dozen. Shipping and handling
is $4.00 for less than 2 pounds. There is no minimum order.

The T50-3 is an iron powder core. Amidon ferrites all start with "F".

^^^^^^^^^^^^^^^^^

Amen to that! Even the ARRL Antenna Book consumes chapters on transmission
line theory and propagation while glossing over why and how antennas work
in a paragraph. Instead it offers cookbook *how-tos* on building classic
antennas with no mention of why they work the way they do. No theoretical
underpinning is offered that could allow an amateur to confidently design
an antenna with a particular set of characteristics. Radiation *is* what
radio is about. One would expect more than a cursory handwave on this
important topic in amateur handbooks, and particularly in an *antenna* book.

2105. Tube Receiver IF oscillates, Help

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-05 13:54:03 UTC
From: ed@fore.com
Message-ID: <Cu2EM4.Ku5@fore.com>
Source record: 116900

Ok older tube hackers, this one is for you.

I have a tempo one, Tube hf rig, I have been using the receiver for
over a month, I borrowed a portable tube tester and removed the tubes
1 at a time. Tested them and put them back in their respective sockets.
All the tubes tested either good or the hi end of the \?/ range.

When I powered tempo up, I got a full scale S meter reading and no received
audio at all, Could not even receive the xtal calibrator.

I started pulling tubes out and finally removed (I think) the 1st IF tube,
a 12AX7A, the S meter went down. I swapped it with another 12AX7A (tx circuit)
and I was able to receive the xtal cal osc, but on AM I was getting a tone that
would zero beat and then increase in freq when I qsy +/- the calibrate signal.

Is there a possibility that the tube checker (an EICO briefcase style) could
have damaged the tubes? They all checked good, or near good, and no shorts.
I am wondering if I may have cracked a tube socket solder connection pulling
& inserting the tubes.

I did not have time & energy to get into it deep at midnight last night (YAWN).

Ideas? Things to check? Similar Experiences?

2106. New Life For Old FM Rigs

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-05 14:36:03 UTC
From: greg@netcom.com
Message-ID: <gregCu2GK4.JGv@netcom.com>
Source record: 116902
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

It's a shame to retire my Drake UV-3 to packet service, now that virtually every local repeater requires PL tones.

So I've been thinking about setting up an outboard sub-audible and DTMF encoder. Now the encoder and the DTMF pad are easy to obtain. However, most of the encoders seem to want a 5-bit encoding of values from 0-31 to select the sub-audible tones.

The control circuits seem like a significant challenge. Does anyone know of a construction article or a kit for a sub-audible encoder with a human interface which is better than a row of dip switches?

I've never heard it mentioned that the metal cans admit light around the leads, but I've definitely seen plastic package transistors that are not even close to opaque! It just depends on the fillers in the epoxy. Some can be used as photo-transistors! Start smashing plastic transistors of random types from different vendors, hold the shards up to the light and sooner or later you'll find some that are not opaque black, but actually translucent brown.

When the temperature gets cold *enough* :-), take a look at the kT
terms in the diffusion equations.

But then, I can't imagine a 6L6GT working at -273 C, either :-).

Communication Specialists has an encoder that can be programmed with
a 31-position switch. You could also use a pair of hexadecimal thumbwheel
switches with a little translation table, or an EPROM with a switch that
contains just the PL frequencies you need. How much room do you have
for the controls? Is there enough room for hex switches, a rotary switch,
or whatever?

Metal-cased transistors indeed can leak light. I noticed this a long
time ago (22 years?) with a Siliconix dual JFET I tried to use as an input
follower in front of an op amp; in the dark, the input bias currents at
room temp could be in the picoamp range or below, but with some light,
things fell apart. It was a lesson not forgotten!

>I am wondering if I may have cracked a tube socket solder connection pulling
>& inserting the tubes.

Since all you did was pull the tubes and replace them, I would immediately
suspect a cracked/cold solder joint on one of the socket pins, probably
a cathode or (if there are anything but dual triodes) screen bypass capacitor
coming unconnected which allows the tube to self-oscillate. There could be
other reasons owing to the same cause (bad connection), such as a disconnect-
ed wire or some such, but I'd definitely check the sockets carefully. Use
a magnifying glass if you have to, and if a pin connection looks doubtful,
give it a touch with your iron (or gun, if you still use one on tube stuff
like I do).

If the connections are all good, try cleaning the tube pins & sockets
by spraying cleaner on the pins and the socket and inserting & removing
the tubes a couple of times to clean the surfaces.

>
>
My complaint about the Handbook is that the ARRL is living in a bad
time-warp regarding the actual Amateur practices that are common and
fairly universal. An exellent example of this is the 1976 issue, look
in the section for mobile/portable stuff, it seems somebody was smoking
funny stuff because there, clear as a bell is an article on how to build
a 2m AM portable transceiver! Really useful! Even in 1976 FM was king in
the 2m universe! FM ht's were all the rage! Not mention one of it...why?

Same issue with the section on FM Communications, the author exgets in
mighty fashion about the Amateur use of re-crystaled commercial gear with
fixed tuning by crystal "required for precise frequency netting on FM.."
..Oh please! In 1976 there were lots of amateurs running both homebrew
and commercially made amateur rigs that had variable tuning for FM 2m
operation...where the hell was the author of that section? Stoned-again?
Or just living in a Newington-Haze?

The truth is, if you look at a range of Handbooks, you will find that some
of our illustrious wisdom is passed from one issue to another, with very
little updating. This a bad publishing practice! Those sections should be
dealing with the current state of the art practice and methodology - not some
reprinted junk about building with nixie-tubes or thumbwheel switches!

I agree that the Handbook should have a general smattering of information regarding the various bands, modes, operating practices, general circuits and theory, plus some history. Then put the more "exotic" stuff in a series of COMPANION VOLUMES! And keep those up to date..I've noticed that they have FINALLY updated the Mobile & Portable book and the FM Guide...still, it sure took long enough! My ploy is to preview these things at a local (Henry Radio) and if not much has changed in them - I simply refuse to buy them!

Are you listening ARRL??

And while we're at it, when-Oh-when are they gonna include some amplifier circuits for 6m/220/450 & 1.2 that use MODERN TRANSISTORS?? (A water-cooled tube amp for 1.2GHz is an accomplishment alright, but not too useful if you're planning to run mobile!

Hi Greg.

It would be a very simple matter to program a ROM to output the correct 5 bit code when addressed by a pair of thumbwheel switches. You would simply dial up a number between 1 and 31 inclusive and the ROM would convert that number to the correct 5 bit code.

There are lots of ways to generate 5 bits of data. It depends on what degree of flexibility you need.

You could use a pair of hex or octal switches. Hex switches are available from most surplus dealers and octal switches turn up once in a while.

If you expect to need 12 or fewer tones, use a diode matrix and a rotary switch to get the codes you need. To do this, put a pull-up resistor on all five inputs. Ground the wiper of the rotary switch. For a given position of the switch, decide which bits you will need as zeros. Connect diodes from those bits to that position, so that the diodes pull those bits to 0.7V. Label the rotary switch with the resulting PL frequencies and you're all set.

You could combine the DIP switch and rotary switch approaches for up to 11 diode-programmed tones and one DIP-switch-programmed tone.

Finally, if you can get access to an EPROM or PLD burner, you can burn a chip to do whatever kind of encoding you want.

Stephen

Hi there, I am not too sure if you guys get a lot of questions like this, but here's a shot.

I am looking to make my own CHEAP, high gain/low loss 2m/70cm antenna. II'm planning on operating a 5W handheld (all my budget can afford...) and got a lot of coax cable (not sure what it is but I think it is 8240 if that is correct??) I am only going to need about 5-10 feet from the inside of the house to the outside. I was planning on putting up a dipole along the side of the house that is always away from the sun. I don't care how long the antenna ends up being, I just want the BEST possible range...ie high gain & low loss.

Please let me know of any help you may have on this subject.

Thanks in advance,
Justin

Hi! I have, for a number of years, been interested in home-brewing a decent HF transceiver. I don't know about other people, but I find that in modern transceivers there are a plethora of functions which I don't use or need - and this is where my hard-earned bucks are going, and not into providing the basic function - a unit which can adequately handle the harsh RF environment of today's amateur bands. Many of the kits on the market these days have had many corners cut during the design process in order to keep costs down, and therefore tend to lose out badly in areas such as internal shielding to minimise spurii, etc. My ideal transceiver would be a modularised unit which I could use as an experimental test platform. One possible use would be trialling new HF modes, e.g. unplug the SSB module and insert a new modulator / demodulator module required for the new mode.

My question is as follows: does anyone out there have know of suppliers / stockists who carry modular sections suitable for use in such a project. Essentially, I'm looking for all sections of a transceiver, e.g. Oscillators, amps, IF strips, filters, audio processors, modulators, demodulators, power amps, etc.
E.g. where can I buy a 90 MHz IF amplifier strip from? Or, it might be 100 MHz, or even 110 MHz - I don't know yet! What suppliers can sell me an RF amp module which exhibits good third order intermod and blocking performance? Who can sell me an SSB (or even NBFM!) modulator/demodulator section? Has someone designed, tested and marketed a PLL kit?

My interest is not such much in soldering up the modules, but being able to mix and match "off the shelf" units (of proven and known performance) during the system design process in order to come up with an optimum transceiver design.

Thanks in advance, & 73's

Please forgive me for cluttering up the system with this. Zack: If you are there, this is the only way I can get an e-mail to you, since I know you're here. For about the last three weeks I have been sending you numerous e-mails, all quite properly addressed, and every last one has been bounced by The System, as "user unknown". Just curious; have you been getting e-mail from anyone lately? Some folks on the QRP list say they have successfully contacted you, but The System sure doesn't think you exist when I try it! 73...

2127. Re: HF preamp circuit NEEDED

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-07 22:10:31 UTC

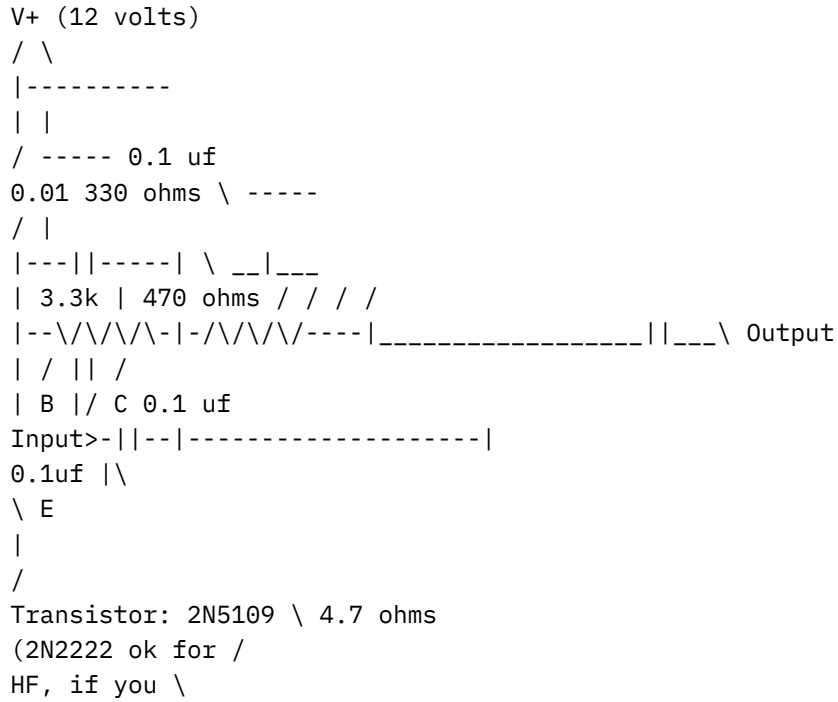
Do you *really* need a preamp on your HF rig?
Do this simple test: Listen to a "dead" portion of the band and
note the noise level (listen to the way it sounds if it doesn't move
the S meter.) NOW, disconnect the antenna and connect a dummy load
if you have one.

If the S-meter dropped, you DO NOT need a preamp (unless you wanted to
hear the noise better... I've met stranger people...) If the noise
SOUNDS less, you STILL don't need a preamp unless, again, you REALLY
like the way noise sounds.

The only time I've seen where a preamp would be nice on HF would be if
either your receiver needs a lot of help (My old TR-3 can't always hear
the Mode A 'birds'...) to hear some of the satellites, or if it is just
'plain deaf. Also, one sometimes need a bit of help when using a sub-
optimal antenna (like a Mobile antenna...)

Here is a ubiquitous circuit. I use it on my 6 meter transverter.
Its noise figure is pretty high (about 5db) but then again, since I
can usually hear anything that is there at all, it doesn't need to
be much better... If you use the recommended 2N5109 (the same as an
ECG278) it has good return loss from 1.5 through 70 MHz with about
10-12 db gain. It *will* work with a 2N2222-type transistor through
HF, but its performance will be less than that of the '5109.



insist...) __|___
/ / /

If this is used in front of an HF rig, keep in mind that it will amplify from several 10's of KHz to several hundred MHz (in the case of the 2N5109) so it would be wise to put some sort of bandwidth limiting component in front of it (antenna tuner will usually do it...)

Also, if you aren't planning to put 50 ohms into this thing, don't expect it to be very quiet!

Also, do not skimp on the emitter resistor: It really ought to be there... If you don't have the 4.7, use something between 2.7 and 10 ohms (just don't ground it directly...)

Again, unless you are listening to Satellites, I *really* doubt that you need a preamp...

Hi!

I did this, and was told by the machine that it was no longer anonymous ftp,
and to go to ftp.netcom.com. This I also did; but, couldn't find any
evidence of NEC files - there are literally zillions of directories under /pub,
and nothing appeared obvious. Do you know if the anonymous ftp site still
carries the NEC files, and if so, what directory path should I use to point me
in the general direction of the ballpark?

TIA

Amen to that.
I'd like to see some moderate-power, transistor amplifiers for 6m/2m/220/440, suitable for CW/FM (class C). You can find QRP stuff, or legal limit amps, but anything in between (say, 25-100W out for 1-5W in) is out. There's a couple of these in older handbooks (I have a '76 with a decent pair of 2m amps in it).

Many, many hams run an HT at home, and could use a project like this. Granted, such amps may not be a newbie project, but that's what Elmers are for...

Hello all;
This is the first place I could think of to post just such a note, if anyone can suggest another place I'd appreciate the pointer.

Here is the problem I'm facing, I have a friend who managed to dip a marine band handheld radio into the ocean for a short moment. Although the moment was short, the radio was not immediately rinsed with fresh water, thus some corrosion of parts must have taken place.

I'd appreciate some advice, what kind of nasty business can saltwater do to a radio? Anyone ever manage to dip a radio and manage to fix it afterwards? The owner of this particular radio went back to the point of sale, the sales person said in appoximate terms, "the radio is done for...."

The radio is a Realistic MTX-120 VHF Marine Transceiver. The model number is 19-1050, and serial number 05001434. I'd apprciate any pointers to where I can find schematics, parts lists, allignment proceedures, but especially troubleshooting and testing guidelines. I do have access to suitable lab test gear.

I'm just starting my adventure, so advice is welcomed. I noticed the Uniden logo inside the radio cabinet. Thus, the radio must have been manufactured for Realistic by Uniden.

Thanks;
Jonathan Hill/N1QOL

Message-ID: <325tbv$1g6@bigboote.WPI.EDU>
Source record: 116823

Hi;

No doubt RF building blocks do exist, there are a few companies that
make such modules, sorry I don't have a list on the top of my head.
I've seen a few guys make references to mini-circuits. Thats one company
that makes plug and play modules, there seems to be oodles of companies that
make similar stuff. I've heard that Motorolla makes power amplifier modules,
but don't know if the parts cover that frquency range. I have seen a few
advertisements for such items but have tried none of them myself, sorry.
I cannot make any claims since I don't know personally about the stuff.

One thing that you must be careful of is that many manufactured parts
are only cost effective if they are manufactured AND sold in large quantities.
In other words, in building your radio yourself the final price tag may be
far more exspensive than a manufactured radio. If you are really not so
concerend with price, but feel a need to build something that is unavailable
then you may feel more comfortable.

If you possibly can, try to use "standard" parts to save yourself some
money. You can benefit from selecting parts that are meant to be used for
consumer products, say cellular telephone.......Many parts used to build
homebrew gear was meant for other gear. For example some of the transistors
used in homebrew ham gear were actually designed for use with consumer grade
CB radios.....

Good luck in your endours...

I'm in need of advice and/or information on getting signals through
to a submerged remote vehicle. We're currently running at about 50MHz,
mostly due to the availability of six meter radio control gear. I know
the Navy uses a buried VLF array to get to submarines at depth, and I
wonder if I could use a *very* reduced scale version of what they're
running -- perhaps a submerged loop? I've considered using ultrasonics,
and any advice in that area would be invaluable as well

Oh, I should mention that I'm interested in distances on the order of
fifty to a hundred feet, if possible.

Any and all input is welcomed. :) Thanks for your time!

Cheers,

2137. Phase shifters

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-08 21:26:11 UTC
From: Michael@arkas.demon.co.uk
Message-ID: <776381171snz@arkas.demon.co.uk>
Source record: 116827

Who knows of a circuit that will do this?

```
[==============]
[ Variable ]
-------->[ Phase ]------->
Input signal [ Shifter ] Output signal with phase P2
with phase P1 [==============] linearly dependent upon input
I phase P1 and control variable C.
I
I
Control ^
Variable C, e.g. volts, current, (via digital word value!?!) etc.
```

This has to operate at RF, i.e. somewhere above 30 MHz, and preferrably somewhere in the 60 to 100 MHz range. It would be nice to have a wideband circuit, but I suspect that it will be narrow band, and this will do.

Circuit design needs to be repeatable, i.e. if I build (or get built) say 8 or so, then I should be able to get the same results out of each one for the given input conditions. Some set-up tuning is ok.

Linear dependence of P2 on P1 and C can be non-linear: so long as it's predictable and not wildly non-linear!

Preferred phase shift range is > +/- 90 degrees, but will settle for less if that's all there is.

Why do I want this? For an active HF phased array antenna design which requires phase shifting as one means of achieving beam-forming.

Water damaged equipment is often repairable. The most important thing is NOT TO
TURN IT ON until you have had a chance to do the following:

Open the radio. Take an old toothbrush and scrub the boards *carefuly* under
luke-warm running water. In extreme cases, you might have to use a mild
detergent (be careful that it doesn't eat anything). Of course, avoid getting
water into anything like transformers etc.

If there are components that are obviously too far gone, you will have to
replace them; although if it was just a quick dunk, you are probably alright.
Next, put the thing (minus the case) into the oven at about 60 deg. C and
leave it for several hours. When it is cool, reassemble the unit but hook up
a variable power supply in place of the batteries. Slowly bring up the voltage
to the rated nominal voltage. NOW turn it on. If you were careful, meticulous,
and somewhat lucky, the radio will be fine.

Good luck

Merrimac Industries (201) 575-1300 sell both digital and analog
voltage controlled units with a frequency span of up to 1 octave, some
of which are in the range you mention.

2142. DSP for the HomeBrewer?? (part2)

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-08 22:55:20 UTC
From: ahall@ux4.cso.uiuc.edu
Message-ID: <ahall-0808941758330001@ruger-68.slip.uiuc.edu>
Source record: 116829

Hello again everyone,

This is kinda an update to the question I first posed about homebrew DSP. I have since my last posting recieved the chip that I had new was coming, and I have some information that might help anyone who wants to make suggestions to me.

Again, I must say that I am very new to the concepts involved with DSP, and I have a long way to go to understand these concepts. So, even if you think you can't give me a schematic or anything, but know some basic concepts, and where you learned about them, I'd love to hear from you. Right now, I think I am looking at a year-long project (school and work take precedence, so this may be a sunday-night hobby sort of thing), and I know that a lot of it is going to be research-based.

I have recently read the following articles, and I suggest them to anyone who is just like me and starting out. (the very basics and not too long, but you get the idea).

"Low Cost Digital Signal Processing for the Radio Amateur" September 1992 QST pages 43-51

"An Introduction to Digital Signal Processing" July 1991 QST pages 35-37

Again, one is basic, one is a project. This is obviously not the best sources, and in no way can cover even some of the basic concepts, so it's just a sort of "hello, here is a bit on DSP" thing.

-Please send me your suggestions on articles/books/ftpsites for any information, or programs related to DSP.

Here's some information about the Analog Devices chip that a good friend gave me.:

ADSP-21msp50 (I have the non-surface mount chip- ceramic case, 144pins I think)
16bit Sigma-Delta ADC and DAC
Anti-aliasing and anti-imaging filters
programmable gain block,
AGC and digital voiceband filtering
2k words of on-chip program memory (RAM)
1k words of on-chip data memory (RAM)

I guess from the literature on the chip that I have, that it is widely used for Voice compression/encryption, and manipulation. It is only good for audio-freq's because of the sampling speeds, but that's all we need for ham purposes right?

If anyone can point me in a direction, please e-mail me. Right now, I pretty much am up in the air about the needed computations for ham's basic DSP filters etc. I'd love to find some example (ham-filter type) code for the eprom programs for any dsp chip.

(I have to thank Ralph kc3f for the great e-mail help he's been giving me. -thanks!)

He suggests the following reading:

The best book I've seen on digital filtering in general is called
Discrete Time Signal Processing by Oppenheim & Schafer (1989).
Another good text would be Digital and Analog Communications Systems by Couch (1993).
Both of these are EE texts, but if you have had calculus and DE you ought to be able to make some headway.

Thanks for the help! I'm sure I'll be posting again over the course of the year :) This is going to take a while :)
But, if you don't learn, what's the point of home-brew? So far (only 1 project, and one going) I love home-brew. You learn TONS, and you can show off your work (not to mention you get a useful product in the end- usually :)

I look forward to any comments/suggestions/help that anyone gives to me.

TNX again et 73!!

Well, Jonathan, you've got some work to do. I've seen handhelds take a swim in the Chesapeake Bay and Patuxent River. I'm not sure of the total time that the rigs were actually in the water, or how long it was until they were delivered to us for servicing. The first thing we did was to give them tap water baths, and then an isopropyl alcohol bath followed by a long, slow bake in an oven to dry them out. Some cleaning of the traces and contacts was done with a small acid brush while in the alcohol bath.

Of course, some of the rigs were turned on and needed some troubleshooting and repairs to bring them back to life, but there were a few that worked immediately after backing and powering up!

You should be able to order a service manual for any Radio Shack equipment directly from your local store, unless they have changed their policies in the past year or so since I've been overseas here. Which I doubt.
I would base my opinion whether or not to repair, on who it was that told you they wouldn't do it. That is, did you have them send it off to the regional repair center, or was it just the store manager that looked at

it/heard the story, or even someone less.

Good luck with your rig.

Tom, I can provide info on a 3 band solid state linear amp covering 6, 2 and 222 MHz and everything in between. It was designed by John, KB3XG, and a paper was given at the Mid Atlantic VHF Conference last year. It uses two FETs and runs on 28 volts. You'll have to build a 12 to 28 volt power converter if you're going mobile but that isn't all that difficult these days. Drop me a note with your address onit and I'll send you the info. It's built on G10 board and isn't all that difficult to buile but it isn
't a "Heathkit".

Tom,
I'm new to this and I think I may have screwed up the reply to the question on dolif state amplifiers. In any case whoever is interested, the 6 meter, 2 meter, and 222 MHz broadband amplifier has around 120 watts output linear.

From: christos@kuhub.cc.ukans.edu
Message-ID: <1994Aug9.001658.70244@kuhub.cc.ukans.edu>
Source record: 116836
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

hello there,

I have a question concerning design of a simple amplifier using
operational amplifiers. I am simply designing a noninverting amplifier with a
gain of 2, that is R1=R2 (Closed Loop Gain=(1+R2/R1)). No matter what I apply
to the input of the amp the output always saturates to -11 Volts. Even if no
input is applied the output still gives a -11V.
The voltages that I am applying to the Vcc+ and Vcc- of the op amp are +12V and
-12V respectively. I am using the LM 741 opamp for this application.

Does anybody in this group happen to know what the problem might be?

I would appreciate any relevant response.

Please e-mail.

Thanks in advance

Chris

2151. Freq standard from TV Colorburst subcarrier

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-09 07:16:05 UTC

Greetings!

Does anyone remember an old Radio Electronics or Popular Electronics article that allowed one to use the colorburst subcarrier of any TV station for use as a frequency reference. I remember reading that only network stations (CBS, ABC & NBC) have their colorburst traceable to NIST, but still it's a good stable source for a reference.

I remember the board used some special chip that took 3.565 (whatever) the coloburst freq is and put out 60Hz, 100Hz or some similar reference frequency standard. I believe it had some sort of op-amp that inductively coupled the colorburst signal out of a nearby TV to this special chip.

Well any leads to parts or even a more recent article about using TV signals for frequency standards would be apprciated.

Thanks!
- Cliff

Why would you want to use a TV station when there is WWV for free, and it's more accurate??

If you have an app that needs this kind of accuracy, the WVV signal can be received at the usual standard freqs of 2.5, 5, 10, 20 MHz, and the long wave on, I think it's 60KHz. Or if you're worried about the atmospheric interference, there is also a way to call the NIST over land line.

How about an H-P standard freq generator for a few tens of thousands of $. I forget if it's cesium or rubidium... probably cesium.

Don't know about your area, but the TV stations go off the air at night around here. WWV and WWVH won't have that problem. One or the other will always be available. 'Aloha'.

>Why would you want to use a TV station when there is WWV for free, and
>it's more accurate??

You have it backwards -- the color carrier (when it worked), was
more accurate. They were both based on atomic standards and the
TV signal since it is local and VHF would have less noise than a
HF WWV signal.

Now however, with the widespread use of digital frame synchronizers
you can no longer count on the color carrier being better than a
normal crystal oscillator, with the possible exceptions of a few TV
stations located at network sites (Los Angeles, New York?).

Look into GPS (satellite microwave spread spectrum), LORAN-C (100
Khz pulse), or WWVB (60 Khz).

>long wave on, I think it's 60KHz. Or if you're worried about the

I wasn't so much looking for a project as lamenting the fact that no such is in the Handbook. It sounds great, though! Exactly the kind of project a lot of hams could use.

I'd like to see less 1000W dummy loads and 2000W forced-air cooled amplifiers, and more 5W in, 50W out 2m amps, and easy to build test equipment to make sure your project is up to standards (some of that in there already). Also, some simple transistor rigs for the fun but little-used modes. The 6m CW/SSB rig in "Solid State Design" is a good example. Also like to see enough design info presented that the projects can be understood and adapted to other needs - the Handbook is already pretty good about the level of math included, just need more of it where appropriate.

BTW, I have all the parts for that 2m amp in the '76 handbook - you can still get them. I'm gonna try putting it together soon.

Well since you have lots of coax, the highest gain antennas you can
cheaply build would be coaxial colinear verticals. Construction plans
appeared in 73 Magazine a while back. As with any VHF antenna, the
higher you can mount them, the better your signal will be.

>
>Oh, I should mention that I'm interested in distances on the order of
>fifty to a hundred feet, if possible.

Ah, this is easy. At VLF this is still near field induction. Just
submerge as large a loop (multi-turn) as you can, and pump some
power into it. You can use a ferrite loaded loop on the sub. There
will be directional effects as the loop orientations change. It
may be necessary to use two loops at right angles.

You can also use sheet conductance for this task. That just requires
two "ground" rods or probes you drive into the bank or place directly
in the water. Feed power to these, and use probes at either end of
the sub to sample the electric field in the water.

In either case, operation directly at audio frequencies will work.
In fact, you can just amplify modem tones for the sheet conductance
method. Something on the order of 50 watts should work great. Just
use an audio amp driving a line transformer to match impedances. The
receiver is nothing but a phono preamp driving a modem chip. (You
may need a 60 Hz notch filter here.)

One book I've found particularly helpful is "Digital Signal Processing in Basic" published by Butterworth (!) and written by G.B. Lockhart and B.M.G. Cheetham.
It covers Fourier transforms, filtering, and other things; it has both the math and the algorithms. An excellent introduction.

MACom? MACom?!? Are you sure that's not for 10,000 units? The last
time I tried to deal with MACom (admittedly about five years ago) they
weren't interested in my measley several hundred dollar order. They
were perfectly willing to give me a hard time as long as I paid
the long distances charges.

I would be glad to hear that they have become more reasonable. I've
been ignoring their ads because I didn't need the grief.

Well, it use to be true that the network stations were traceable to NIST (then NBS). That was because they all took feeds (timing and all) directly from the network feed. 10 or so years ago all the stations started to use frame stores that could retime network feeds to locally generated timing. This solved a bunch of timing problems for the stations and simplified things. It also put an end to the traceability (and short term acuracy) of the color burst and NIST abandoned the program. Now WWV(B,L,H), Loran C, and GPS are about the only broadcast standards tracable to NIST.

If you only need a local syncronizing standard you could still use a TV station's color burst for that. In fact I suspect, though there are no guarantees, that the big network stations have pretty accurate frequency standards distributed throughout the the station. But there isn't any traceability and if you happen to be unlucky enough to be calibrating some instrunments the day the stations clock source is on the fritz you have no way of knowing. Still I have thought that using TV signal components like color burst would be a nice way to syncronize a bunch of simucast transmitters for a ham wide area repeater or provide a timing source for a spread spectrum link.

I haven't seen any articles published since NIST gave the program up. And that must have been as much as 10 years ago now.

I built one of these back in 1978 (or thereabouts). I never saw the
article but I think I know most of the details. First, the basics:

3.58MHz is actually derived from the ratio of two integers. I don't
remember exactly what they are but, for now we will assume they are
14 and 39 (but I know these aren't correct). So 3.58MHz = 10MHz x 14 / 39.
Using a phase-lock-loop, you can therefore derive 1MHz, 5MHz, and 10MHz
from 3.58MHz. Similarly, you can derive 3.58MHz from 1, 5, or 10MHz.

The 3.58MHz signal in the TV is locked to the reference at the source
of the TV Signal. Your TV uses a PLL for this. Every horiz blanking
interval, the TV's local 3.58MHz oscillator is compared with a burst
of 3.58MHz from the transmitter (the colorburst). This way, your TV's
3.58MHz reference is kept in sync with the 3.58MHz at the transmitter.

There is no guarantee that the 3.58MHz of the source (transmitter) is
correct. It is usually close but definately not a great reference.
When the TV programming comes from the Network (not the local station),
the 3.58MHz is usually very close. (I think they use those expensive
Ceisium (sp) Oscillators.) The evening news is a good network feed.

The FCC (or maybe the Federal Bureau of Standards) used to monitor the
networks 3.58MHz color burst signal and publish the deviation on a monthly
basis. This was discontinued in about 1980.

Now, the idea for creating a local lab standard was to build your own
1, 5, or 10MHz oscillator. Derive 3.58MHz from it using a PLL. Use a

phase comparitor to compare your 3.58MHz to that of your TV during a network broadcast. Record the deviation as detected by the phase comparitor (usually measured in seconds/cycle of beat frequency). Compare your deviation to that published in the FCC's monthly report. Adjust the frequency of your reference oscillator and repeat the process.

In my design, I used a high quality Vectron 10MHz Oscillator-complete with an oven to maintain temperature and oscillator stability. I think the oscillator was rated a 1 part in 100,000,000,000 for short term and 1 part in 1,000,000,000 for long term stability. I think it cost around $200.

I divided its output by 2 and 5 to create a 5MHz and a 1 MHz output respectively. I also divided the 10MHz by 39 to create 256KHz and a PLL to multiply this by 14 to get 3.58MHz. The PLL requires a 3.58MHz VCO which I built using a voltage controlled cap (diac?) and an ordinary 3.58MHz crystal from a TV.

I had an input from the TV's 3.58MHz oscillator and used a phase comparitor to compare this with my derived 3.58MHz. The output went to a analog meter (for making rough adjustments) and to a chart recorder when the phase difference was very small (measuring several seconds per beat).

In addition, I could use the phase comparitor to compare the 1, 5, or 10MHz output with an external signal. This allowed me to calibrate other equipment to my standard.

This project was complicated by the fact that all these frequencies operating in the same cabinet result in a lot of coupling. I had every oscillator (the 10MHz and the 3.58MHz) and both phase detectors (the one from the PLL and the one to compare the internal reference to an external source) in separate metal boxes. I think I even used separate power supplies for each circuit.

It worked well and, as far a I know, is still is use today.

Hope this helps and good luck.

I just bought (or am in the process of buying) a power supply for my HTX-202. However the power supply is 13.8VDC and 3A. I know the 202 works fine at ~13.5VDC and 2A (car battery). Will the slightly higher voltage and amperage cause a problem? If it is a problem, I should just be able to add a resistor in series to get the amperage down, correct?

> voltage and amperage cause a problem?

The voltage might, but it shouldn't really be a problem. Check the 202's
specs for maximum voltage -- it's probably 14V or more.

The current rating of a power supply is a maximum. Anything less is
generally OK, though some switching supplies specify a minimum load
current as well as a maximum. How do you find out whether your HTX-202
will overload the supply? Easy -- check the specs again. This stuff
is always in the manual somewhere, usually near the beginning or the
end.

For reference, my Heath HW24HT dual-band handheld is rated to operate
on anything from 5.5 to 16V and draws up to 1.3A, depending on the
output power and the band. Your power supply would work with it; in
fact, it can supply enough current for two radios like my Heath.

Oh, one more caveat: Be careful if it is a switching power supply.
Some switching supplies have large ripples at a couple of kilohertz
on their outputs. The result can be a whine in a radio's output. The
only way to see if a particular switching supply works well with a
particular radio is to try it out and request some signal reports.
Linear power supplies don't have this problem.

As others have pointed out, TV stations use frame syncs to accept network programming into their locally generated house sync and burst. Which usually come from a Tek generator with a pretty good crystal osc.

A reason for not directly using the network feed is that the feed goes thru satellites. And those satellites wander some out there in space, introducing some doppler shifts in the TV signal frequencies. So much for tracability.

2174. Quadruple Sideband?

I was thinking about how many distinct voices might be possible in a 5 KHz channel. It seems to me as if you could put four voices on a single channel. That is , USB , USB quadrature , LSB , and LSB quadrature. And it seems as if you could build a special receiver to select which one.
It also seems to me that it might be possible to squeeze a third phase into each sideband (like the color signal in a TV does with R,G,B). And also you might be able to put an AM signal and Quadrature AM signal on top of that. Since the AM appears in both sidebands, you could extract it kinda like how stereo L and R are separated in FM radio. A matrix or something. So now we have 8 stations on the same frequency and I think it's possible to separate them so that you only hear one. (on an ordinary receiver you'd hear them all). Is this correct? Maybe I havent thought of all the ways you can squeeze them together. What then is the limit?
If a lot of people are talking in a room you may be able to listen to one particular person and ignore the rest. At some point, there are too many and then you can't. Does this have something to do with it? I think Phase has something to do with where it sounds like someone is coming from. Perhaps its possible to make a microphone/device which would let you hear a single person and not all the others in the room. It probabley would need only two channels (ie. two sidebands or phases). And in that case, there is an infinite number of radio channels,Right?

My 13 year old just loves to build stuff and take stuff apart, mostly
electronics. His current project is to make one of those toy guns where
each player has a receiver (target) and a "ray gun" infrared transmitter.
He really has had no training at all, and since I'm a mechanical engineer
I'm virtually no good to him at this point. He got one of those "electronic
engineers notebook" from radio shack with a simple circuit. It calls
for a transistor they didn't have in stock and an op amp. He built
it without those and lo-and-behold it sorta works anyway, but the receiver
is sensitive to the kitchen light too. Also range is just about 2 feet
(without the magnifying glass lens shown in the book). Anyway by 10:00
last night he was pretty discouraged about the whole thing and the idea
hit me that there might be some help available through the net. Now,
he is only 13 with no formal electronics training, virtually no money
and is interested in making things that actually DO something. Like
the robot made from an old RC car with LEDs and photocels and stuff.
And the model rocket launcher that you can aim because he hooked up
an old cassette deck to an erector set turntable, myriad different burgular
alrm systems for his bedroom, ad infinitum. As far as my ability to
help with time, energy, money, brains (if any) and such, I have 3 other
kids equally demanding in their interests and gifts. So I need help.
Anyone have some advice? Sources of simple gadget circuits? Cheap
IR gun circuits/hardware? Even old stuff for him to take apart that
might be reusable in projects (preferably low voltage stuff says Dad)?
Pleas respond by email if possible since I don't get to read news much
and have crossposted to several newsgroups.

Thanks for reading through this rather lengthy request.

>just be able to add a resistor in series to get the amperage down,
>correct?

The nominal voltage of a fully charged car battery is 13.8 volts. That's why most fixed supplies put out that voltage. In a car, the charging system can increase that voltage to 14.5 volts, sometimes even 16 volts, so the radio has to be able to work with that if it can be run off the car. All you care about as far as supply current rating is concerned is if it can put out *enough* current. The radio will only draw as much as it needs, so a bigger supply is not a problem.

This is a basic Ohm's Law problem. Model the circuit like this:

```
----------------
+| |
Bat 13.8V Radio 6.9 ohms
-|_____________|
```

Assume the radio is a resistor (it's the load), and that if the radio normally needs 2 amps at 13.8 volts, it has a resistance value of 6.9 ohms. Now it doesn't matter how much current the 13.8 volt supply is *capable* of producing, at 13.8 volts it can only push 2 amps through a 6.9 ohm resistor. I=E/R or 13.8/6.9=2 amps. The only way the supply can push more than 2 amps through the radio is if the supply *voltage* is increased, or the radio resistance is somehow decreased (it can do that by outputting more RF or AF power). Let's assume a auto charging system voltage of 14.5 volts. Now how many amps will be pushed through the radio? The answer will tell you why higher voltage batteries allow HTs to transmit more power. (Remember P=I*E)

Now obviously solid state devices have an upper voltage limit, and exceeding that limit will destroy the device via voltage breakdown and current avalanche. So you never want to use a supply that has a higher voltage than the equipment is rated for. However, most equipment has a built in *safety* margin of about 20%, so you can *usually* apply a voltage of about 16.5 volts to a 13.8 volt rated radio without destroying it. A few tenths of a volt difference from rated voltage should never be a problem.

TV color is done by a combination of amplitude and phase modulation.
AM carries the saturation. PM carries the hue. There are two
channels there.

FM stereo is time division multiplexed.

Single sideband can be thought of as simultaneous AM (sidebands in
phase) and FM (sidebands out of phase). If you have a phasing rig,
drive one modulator and unbalance it, you get AM. Drive one modulator
and unbalance the other you get FM.

The technique you propose suggests the old 4-channel audio techniques
like SQ and QS. You get a big 3 db channel separation.

>NIST, but still it's a good stable source for a reference.

Not any more. Most, if not all, TV stations now receive their network feeds via satellite and use frame synchronizers to reclock the network signal to their local sync generator (usually only crystal controlled). So even when the station is relaying network programming, the color burst is only referenced to the crystal oscillator in the station. That only has to be within 10 Hz of nominal to be legal.

Satellite transmission also introduces it's own doppler errors that are +/- a few Hz, so even if you can use a TVRO to pick up the network signal directly, you still won't have a stable reference source. And, of course, the networks themselves have abandoned the atomic clocks they once used as references, so the original signal too is only referenced to a crystal oscillator, often not even in an oven.

In the old days, network feeds were over fixed telco paths, no doppler, and used atomic references in NY. Local stations used them as primary references and genlocked their own local sync generators to the incoming network signal. But that's long gone. Today, the networks switch their feeds from uplink source to uplink source during breaks, and that would cause local commercials to tear up from loss of reference, so no station genlocks to network anymore. Instead we use our frame synchronizers to effectively lock network to *us*.

Perhaps, but *DON"T* do that if the radio has just been 'dunked' because you run the risk of getting water into place that probably didn't get water in them from the 'dunking'.

Remember, that soaking and cleaning a radio like this is always a last-ditch effort as in "its garbage anyway, whatever I do next won't hurt"

No. There are only two "dimensions" associated with a carrier.
You can do USB and LSB independently. You can do DSB in phase and
DSB in quadrature. You can do AM and PM independently. But if you try
to do more than 2 signals, they will interfere. For example, USB "quadrature"
is meaningless because carrier phase is not important in SSB.
In fact you don't even need to get the *frequency* of the carrier
right on for SSB.

To get more than 2 independent signals to occupy the same channel, you
would have to go to digital techniques.

Has anyone else pointed out that the colorburst is only constant-phase
in alternate sync intervals? They do this to make the striations of
the color subcarrier less noticeable on B/W sets (those in decent
focus, anyway ;-) and it would noticeably affect your freq reference
system anyway, even discounting the +- 10 Hz spec mentioned in an
earlier post, if not eliminated by some elaborate gating and inverting
scheme ..

just my $.02 ...

Homebrewing a 100+ pin DSP would be a lot of fun - my first entry into DSP was to wire wrap the W9GR project in QST. I found that the DSP would run quite happily with 150ns 2764 EPROMS, but thats only a 40 pin package.

The TI DSK is quite a powerful engine - there also now are nice memory expansion daughter boards available.

Another alternative is to buy an $80 DSP-based PC sound card and use that for your DSP platform. The Cardinal Pro 16, Orchid Sondwave 32, and others use the ADSP2115. A really powerful DSP platform with a lot of free applications materials available. Just an example of its performance - a 1024 point FFT in under 3ms.

Once you start playing with these toys, one quickly realize that programming the DSP is just a fraction of the effort - integrating the DSP into any worthwhile application, i.e. using a host PC's resources - thats another story. Having a flexible DSP board

plugged into your PC's bus and having access to the interrupt/DMA hardware sure makes life easier and offers lots of possibilities.

My $0.02 for what its worth. Good luck with your project.

Greetings to one and all,

Can somebody please tell me the formula for calculating SWR when given only
the forward and reflected power in watts.

i.e Bird Inline reads 15w forward and 6w reverse. SWR=?

E-mail to me or posted on this group would be nice.

Thanks in advance.

Alan-

There are systems used by divers for similar applications. They use ultrasonic sound as a "carrier", which is modulated as if it were a radio carrier.

I think the frequency is in the order of 100 KHz to 200 KHz. It seems that there is a trade-off involved in selection of a frequency. At lower frequencies, the ambient sea noises (waves, whales, et cetera), interfere. At higher frequencies, signal attenuation limits the range. There is a "window" between these, that is useable for communications.

I suggest you ask for information at a diver supply store. I believe there are at least two companies that make these systems. (My information is from about 15 years back, so please forgive my faulty memory!)

Bruce & Greg-

Communications Specialists also has a model that includes the switch, as well as a case. It is the TE-64, which generates 32 CTCSS sub-audible tones, 19 burst tones, 8 touchtones and 5 test frequencies. It uses a 32 position switch, with a two-position switch that selects either the CTCSS tones or the others.

It costs more than twice what the DIP-switch model costs. Are you sure you wouldn't prefer one of the tiny units that fit inside the radio's case? The SS-32SMP is jumper-programmed, and quite small compared to the TE-64.

2189. AGC: Audio vs. IF derived

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-10 22:02:39 UTC
From: zelle@cs.utexas.edu
Message-ID: <32bipv$pbq@thor.cs.utexas.edu>
Source record: 116864
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics

I build radioes strictly as a hobby, and have a question for the wisdom of the net. Most discussions of Automatic Gain Control for receivers state something to the effect that IF-derived AGC is generally considered better, but that audio-derived is "simpler". My understanding is that most commercial shortwave receivers use IF-derived. However, my experience with homebuilt sets leads me to prefer audio-derived (at least for reception of am).

My argument for audio-derived AGC is that it provides much more pleasing performance in the presence of carrier fades, especially in the case of a simple envelope detector. When the carrier fades in the IF-derived situation, reciever gain is cranked up to maintian the IF level, effectively increasing the volume of the overmodulated, distorted signal. This produces a very unpleasant "pumping" effect. I have noticed this in a number of commercial receivers. With audio derived AGC, however, the volume stays relatively constant resulting in a "smoothing" over the distortion. I suppose that sets with synchronous detection do not suffer as much, but I still notice this problem on my Sony 2010.

My question is, what is wrong with my argument? Obviously, there must be a compelling reason for IF-derived designs that I am missing. I am also interested in whether IF-derived AGC is necessary for synchronous detection (to stabilize the input to the phase detector) or whether audio-derived will work just as well (I want synchronous detection in my next homebrew set).

So what do y'all think. I say audio-derived wins hands down. What am I missing?

> To get more than 2 independent signals to occupy the same channel, you
> would have to go to digital techniques.

Rick-

It seems to me that in the case of USB plus LSB, you are actually using two separate communications channels. In other words, you define a double sideband channel bandwidth, and occupy it with two single sideband stations. Each station generates very little energy in the bandwidth occupied by the other station.

However, with the other schemes, you may transmit two channels of information, but not from two separate, independent sites. From separate sites, there would be no coherence between the two information channels, and interference would result. Therefore, only one station could realistically occupy the radio channel, even though it could transmit more than one information channel.

Along those lines, sub-carriers could be used to add additional information. Of course, this would increase bandwidth. The digital techniques you mentioned, would also increase bandwidth, although several stations could occupy a channel if they were either synchronized or using spread-spectrum techniques.

I think the "bottom line" is that only the USB plus LSB scheme actually permits more independent conversations in a given bandwidth. But, this is no different than using all the same sideband, and spacing at half the distance along the band. Quite often, I hear SSB conversations at 2 KHz intervals, which usually works OK. However, you will also hear stations only a few hundred Hz apart on crowded bands like 20 Meters. Although it isn't pleasant, you can usually understand what is being said, using your brain as a "filter"!

John-

If the kitchen light is incandescent, then it generates a lot of IR, and you can't do much about it. However, many IR detectors may also respond to visible light. If that is the case, you can make an improvement by using a red filter over the receiving device. That should do a fair job of eliminating light from flourescent lamps. You may find that range increases when you use the filter, since it improves the "signal-to-noise" ratio.

Another source of IR devices, might be from discarded TV sets that have a matching remote control.

A recent Popular Electronics article described a regenerative shortwave receiver using a dual-gate MOSFET for the RF oscillator. It is well-known that the regenerative approach significantly increases the Q of the resonant circuit. I was wondering, however, if the Q is sufficient to provide the selectivity needed on the international broadcast bands. Can such a receiver really separate relatively powerful signals spaced every 5 Khz? I would appreciate hearing from anyone who has tried such a circuit for shortwave reception. Is the selectivity as good or better than superhets using a simple ceramic filter?

As a side note, I am interested in building a small, portable, SW receiver, and the simplicity of this approach (filtering via a single tuned circuit) is quite appealing. Any other ideas regarding the building of a small, battery-efficient receiver would be appreciated.

Regenerative receivers never had and never will have selectivity as good as the superheterodyne receivers. That's why the superhet became so popular. And now most good receivers are double conversion, so they're even better. No matter how high the Q, a single tuned circuit can't have as sharp skirts as several stages of IFs. And then we haven't even talked about ceramic IF filters.

Hi John, I use a direct conversion receiver whose local oscillator is a DDS circuit controlled by my PC. The audio output goes to my sound-board for DSP-type processing. The biggest problem is images but the PC lock-steps the DDS circuit to minimize the problem. I (blush) use this system for CW only and it works pretty well.

In a super-regen circuit, the skirt selectivity problem can be overcome by using DSP techniques on the audio. However, I don't know any easy way to avoid the image problem. Does anybody else?

John, from my experience of building regenerative sets, you can obtain quite acceptable AM selectivity for SW BC work. The trick is to adjust the regeneration to the point where the set "takes off", (you will hear a gentle "plop") then back it off again slightly so that the detector just stops oscillating. The better sets have an RF amplifier to isolate the regenerative detector from the antenna (which can cause "dead spots, and maybe radiate an interfering signal).

For SSB and CW reception, the detector is deliberatly put into the oscillating condition, where once again, selectivity is quite adequate for most conditions. SSB and CW signals sound remarkably clean by the way (a bit like seeing the sky on a clear night away from the pollution of the city-- signals stand out with a remarkable clarity because there's no mushiness caused by multiple tuned circuits, AGC loops etc).

Gosh! That would have been news to me back in the 60's, when I added a "Q-Multiplier" (a regenerative IF stage) to my not-so-hot single conversion superhet and VASTLY improved selectivity.

My problems with regen rx's were always that they were insensitive, unstable, and a damned nuisence, not that there were too broad.

Aren't there two flavors of this board... one based on the 'C26 and another
on the 'C56 or something ? Is the 'C56 one just a newer version of the
eval kit but you can still get the 'C26 one ? Seems alot of the codes
for amateur applications are for the 'C26 model...

If I order one according to the ad in say, EE Times-- which model will I
get ?

Chris

Brian Ellse (briane@goofy.iaccess.za) wrote:

: Greetings to one and all,

: Can somebody please tell me the formula for calculating SWR when given only
: the forward and reflected power in watts.

: i.e Bird Inline reads 15w forward and 6w reverse. SWR=?

SWR is defined as the ratio of maximum voltage along the line divided by
minimum voltage along the line, when the line is excited with a
constant amplitude single frequency.

The voltage at any point on a line is the sum of the instantaneous
voltage in the forward wave plus the instantaneous voltage in the
reverse wave. The rms voltage in each wave is given by

Vrms = sqrt(pwr*|Zo|) = sqrt(pwr) * sqrt(|Zo|)

The maximum voltage is where the forward and reverse add, and the
minimum voltage is where they try to cancel, so

SWR = (sqrt(fwdpwr) + sqrt(rvrspwr)) / (sqrt(fwdpwr) - sqrt(rvrspwr))

(The sqrt(|Zo|) terms cancelled out between numerator and denominator.)

It's useful to draw a graph of SWR versus reverse/fwd power and tape it
to the back of the Bird. It's not too hard to put the above formula
into a spreadsheet and use it to draw the graph for you. The square root
causes some interesting effects: the reverse/fwd power ratio to get to
1.05:1 SWR, for example, is about .0006 -- pretty hard to read accurately!
The example above, 6w reverse and 15 fwd, is about 4.44:1 SWR.

2209. Temperature Telemetry

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-11 17:23:03 UTC
From: oflber02@uctvax.uct.ac.za
Message-ID: <1994Aug11.192303.1@uctvax.uct.ac.za>
Source record: 116757

I am currently doing a thesis on a Perishable Goods Temperature Monitor.
The thesis calls for a temperature probe which is packed with the goods.
An interrogator then interrogates the probe and a reading is given.
The problem is that the probe is not allowed to have a power source at all.
The interrogator is hand-held and is powered by a battery. An option is
to have a rechargeable set up.
The probe must be as light as possible and as small as possible.
The system must be able to read temperatures between 233K and 313K
with an accuracy of 0.5K
I have thought about using a telemetry system or a transponder.
I have thought about using magnetic, acoustic, RF or microwave coupling
but I do not think I will be able to get enough power from a meter away
to power a IC like the LM35.
The interrogator must be able to receive the temperature from a meter away.
The only thing I have thought of that might work is an oscillating circuit.
The oscillation frequency changes with temperature.
A dip meter is then used as the interrogator.
The only problem is that the only thing I can think of that will vary with
temperature is a bimetallic strip.
The strip can then be used to change the capacitance of the oscillating
circuit.
However I need a circuit for a dip meter which can constantly scan the
frequency range and be able to differentiate the dips so that the required
accuracy is obtained.
Any help or ideas and suggestions are needed and very welcome.
Please send mail to
oflber02@Uctvax.uct.ac.za
Thanks in advance

:Brian,

: SWR = (Forward + Reverse) / (Forward - Reverse)

: With Forward = 15 W and Reverse = 6 W , SWR = 2.33 / 2

Yikes. This isn't correct when dealing with powers. (It is correct for
forward and reverse voltages.) For powers,

SWR = (sqrt(Pf) + sqrt(Pr)) / (sqrt(Pf) - sqrt(Pr))

where Pf and Pr are forward and reverse power, respectively. 15 watts
forward and 6 reverse is an SWR of 4.44.

True, for voltages or currents; not for power. Need to
take the square root of power to get a number proportional
to voltage.

: With Forward = 15 W and Reverse = 6 W , SWR = 2.33 / 2

Would be 2.33:1 without square root; it's more like 4.44:1.

See the August, 1979 issue of QST for an ultra-cheap, 2-element
6-meter quad. Easy to build, works great, and I got a number of nice letters
from other hams who liked it as well (I wrote the article). The title of
the article is "The Carpenter's Delight."

If you don't have access to older QSTs, I'll send you a photocopy of
the article.

Paul, K4MSG

P.S. I used it on SSB, but you could turn the feed 90 degrees and use it
on FM (vertical polarization).

An awfully handy fact in the real world is that 10% reflected power (ie, 10
watts forward and 1 watt reflected) equals 2:1 SWR (well, actually, 1.93:1).
Since many of us figure that a SWR of 2:1 or less is a reasonable match (at
least in most cases), checking for <10% reflected power is a simple go/no-go
antenna system test.

Hello everyone,
I have two completed Hamtronics kits for sale. They are both for the
220 MHz band, and were assembled neatly, stuffed in a seamless aluminum
box and routed with bypass capacitors through the case. They work, too!

220 MHz Receiver (xtal controlled), with 220 Helical Resonator Preamp Kit.

220 MHz Transmitter (exciter, xtal), with excellent output filtering.

These were used for my 220 Remote until the lower portion of the band
got taken away by the FCC. These are quality kits, with a lot of filtering
and parts. Please make a reasonable offer and have your own remote/repeater!

My experience with regens goes back a few decades to the late fifties, when my uncle coached me through the assembly of a regen using a single type 76 tube. I spent my high-school years listening to a Knight Kit Ocean Hopper, and I currently have a 3-tube Heathkit I picked up at the GoodWill. So I'll say I'm experienced with "jennies".

First, with jennies, everything gets worse as you go up in frequency. With your RF tuned circuit giving you all your selectivity, the "bandwidth" is a constant *percentage* of your center frequency, and the absolute bandwidth (in Hertz, say) increases in direct proportion with your operating frequency. Additionally, your problems with hand capacitance, antenna loading, drift, and "touchiness" of tuning all go up with frequency. My experience agrees with the ham magazines of the 1930's: jennies are great at 4 MHz, good at 7 mHz, only fair at 14 MHz, and poor on 29 MHz.

But this also means things get better with decreasing frequency. On the broadcast band, a jennie can be tuned to "cut the sidebands", and give mushy audio; you actually have to back off the regen control to let the sidebands through. At 455 KHz, regenerative Q-multipliers gave IF strips responses like narrow band (CW) crystal filters.

But that is mostly for CW work. The weakness of a jennie that always got me on bands crowded with AM signals was that the machine would produce perfect (interfering) audio from strong stations on nearby frequencies. A jennie, necessarily, is an envelope detector, so any AM that gets past the tuning circuit is

detected perfectly into AF, no matter what its frequency. So any signal that was really strong would show up in the audio even after the "Q-multiplied" tuning circuit was finished attenuating it. And some of these signals can be *really* strong. In the early sixties, I used to get Radio Moscow on 41 meters on a crystal set... but crystal sets are another story. Needless to say, on the jennie, Radio Moscow blanketed most of the 40 & 41 meter bands!

Jennies are still fun. They still the hold the record for the most performance from the fewest components, and they need no alignment or calibration; that's why they persisted as the dominant homebuilt through the hard-time 1930's. But today components are cheaper, and performance expectations are higher. For AM work on SW, I believe a direct-conversion (DC) receiver with some AF filtering would be the simplest receiver that might satisfy you. Look around in the magazines, now that a balanced mixer comes on a chip, very usable DC receiver projects have been published, you can even buy a ready-made circuit board. No, these are not SOTA, but they're not toys, either. A superhet would be better still, and for AM, a ceramic filter would be a big plus.

But me, I have been wanting to build another jennie for the 150-190 KHz "experimenter's" band. It will have all the sensitivity I need, and atmospheric noise down there is so bad that the few milliwatts of QRM radiated by a jennie will be unnoticable. Jennies are at their best when relatively tightly coupled to antennas that are electrically short (a small fraction of a wavelength); other receiver input stages need to be rather loosely coupled, preferably to resonant (reactanceless) antennas. Well, on this band, all practical antennas are electrically short... a potential problem for any receiver but a jennie.

> that by outputting more RF or AF power).

This is interesting. When I got my Yaesu FT-530, I made some crude measurements of the power consumption and found that it never draws more than 1.1 amps on 2m (slightly less on 440) . If you apply 6 volts, it draws the least. Then it draws gradually more current as you turn up the supply voltage, until it gets to about 10.5 volts. It draws 1.1A at 10.5V, and stays that way up to 16V (the max rated voltage). I didn't go higher, since it's my pride and joy. :-)

The receive portion is even more constant. When sitting idle on both bands with no power saving enabled, it draws around 100 mA. It does this at *any* voltage level (6-16). It seems to be a constant-current load for idle standby. Of course, incoming audio, loud volume settings, LED backlighting, and other stuff turns up the current draw.

I realize your resistor model was only an approximation, but I was surprised to see that it controls its current so consistently over the voltage range. I could have measured it wrong, but that's what it looked like.

Happy Hacking!

Thre are a number of ways of doing what you want. See for example Handbook of microwave and optical components, volume 2 - microwave solid-state components, edited by Kai Change, pages 230 - 262. Two methods might work.

1) Design a low-pass pi filter, 2 C's and an L. make the C's varicap (varactor) diodes. As the capacitace is changed, so will the phase shift.

2) Take a hybrid coupler. Terminate one port with a varactor.

I've just purchased a phase shifter to work at 82MHz. Gives 0-360 degree phase shift, with a control voltage of 0-15 V. Quite linear. Available from R&K, but I could give you the UK distributor if you want. Trouble is its a professioanl bit of kit and was about ₧500. Not really amateur prices. This uses 3 hybrid couplers as explained in (2), to get a full 360 degree phase shift.

Sorry, just read you want it for an antenna. If you want to transmitt, then you may run into problems with power for both of these routes.

How about doing it with sections of 50 Ohm line, one say 1 degree, 2 degree, 4 degree, 8 degree ... 64 degrees electrical length. By switch in one or more sectionss, you can get from 1 to 127 degrees of phase shift. Use pin diodes to switch the lines.

Good luck,

davek

Jeez, what happened? A stray lightning bolt hit the antenna? What you need to do is get several cross references and start to compare all the substitute transistors to see what will work. THen see what cheapies will do the job.

Someone left a post about the Japanese transistor numbering system. It went something like:

2SA = PNP Hi Freq
2SB = PNP Lo Freq
2SC = NPN Hi Freq
2SD = NP Low Freq

I've never seen this confirmed or heard it mentioned much, so it may not be valid. And where is the crossover between hi and lo freq? 30MHz? If so, almost every low power silicon transistor made today could be called hi freq.

If that many semi's have failed, I would hate to think of how many other parts may have bit the dust.

By the looks of it, it appears to have sat in some water. There is considerable
damage. There are some parts that I can't even identify. I wish to thank everyone
who responded. MCM seems to have most of what I can identify.

I believe there's a place in California called Dalbani Electronics
that sells Japanese transistors and/or replacements. They have a
catalog but I don't have a number for them handy. If you still need
help, send me email, I'll try to get a number for you.

>scheme ..

Burst reverses phase *when measured using H sync as the reference* on a field to field basis, but the burst retains constant phase if measured from burst to burst. IE it's the H sync position that changes from field to field by a half cycle of burst, not the burst phase itself. This was done to offset the color information so that solid hue areas average field to field. IE it's to reduce color flicker on color sets, not to reduce artifacts on B&W sets. They generally don't have the bandwidth to reproduce hue information anyway.

When they're locked to the atomic clocks on the satellites, they're
as stable as those clocks, minus the jitter introduced by SA. IE
about 0.00033%.

Radio Shack sells an IR detector that works with TV/stereo remote controls. I works with modulated IR beams at 38-40 Khz. This would solve the kitchen lite problem. You IR sender needs to modulate the beam at 38-40Khz. When you use the RS IR detector, it will return +5 if it sees it 0 if it doesn't.

Coincidentally, I just ran into an article this morning in the library:

Coates, Dr Rodney, "Underwater Acoustic Communication," Sea Technology Magazine, July 1994, pp 41-47.

Excellent overview coverage, especially in things like relating range and frequency, power requirements, keying formats, and what's on the market. Readable, too.

: to set up an experiential differential GPS system.

I had an idea. How about linking up a GPS with a cellular phone and
a large battery to power both for a couple of days. Then dial a number
on the cellular where you want the GPS to send it's location info and
drop the whole bundle into someone's car. Since GPS info can be used
with several very cheap street mapping systems (Delorme for one) you'll
be able to sit at home and watch them driving down the street on
your home computer. Should be able to do this cheap. A couple of
hundred dollars (with cheap GPS and cheap phone). I have no ideas
on keeping cellular costs down though. One thought would be to set
the phone to answer and power up the whole gizmo and then shut down
after a call is placed into it. You wouldn't get a continuous
signal but you'd be able to find where someone is on demand (if they're
within cellular calling range). Such a setup could last for a LONG
time with the proper battery.

I did exactly this with a LORANC reciever and Cell phone in LA in 1984.
A small embedded micro sampled the position every 30sec and stored the
information. On demand you called the Cell Phone and it downloaded the
list
of past positions and times. It also tracked things like engine
starts/stops
doors opening etc... It was a prototype for a Truck Tracking System for
Shorthaul
delivertrucks.

: which describes how to do this.

The IETF remote conferencing folks were griping about this a year or two ago. From what I've heard, the SoundBlaster design does not allow for simultaneous input and output.

Maybe this restriction has been lifted in one of the zillions of models of SoundBlasters, but if you don't see docs on it, I'd be doubtful that it's there. I suppose you could use two cards...

The SoundBlaster was originally designed to be a cheap multifunction sound card for games. Games don't do real-time signal processing.

2238. designing microwave circuits using aplac

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-13 02:08:36 UTC
From: klopfer@natinst.com
Message-ID: <32h9v4$4ts@eagle.natinst.com>
Source record: 116680

I'm wanting to design uhf and microwave circuits for packets radio. Since I've not done'designs at these frequencies I was wondering if some persons might answer a few questions. Is software like spice much use? Is its transistor model any good at >1GHz? What about the aplac simulator? I noticed it has lots of microstrip models? Is some kind of network analyzer required to do any real design or is there simulation software that is accurate enough and in what frequency ranges? What's the quickest cheapest way to fabricate a microstrip board? Can some toner transfer methods be used and what kind of circuit board material is best?

I bought a tv tuner
that's suppose to go up to 1700MHz but I couldn't get anything to show up on a 1GHz storage oscilliscope when I connecting the tuner to power. I would like to find the simplest circuit that can get it to work. I've also got a 2GHz prescaler and would like to eventually make a frequency generator from these parts.

2239. TNC construction article

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-13 07:45:18 UTC
From: BSoranno@vax2.winona.msus.edu

>
>I realize your resistor model was only an approximation, but I was
>surprised to see that it controls its current so consistently over the
>voltage range. I could have measured it wrong, but that's what it
>looked like.

That's not surprising. Two things are at work here. First there is
almost certainly a voltage regulator circuit in the radio to feed
the digital components. It's pass element will act like a variable
resistor depending on the input voltage. That, when summed with the
load presented by the radio circuitry, will present a near constant

current load on the source.

The second factor is a bit more subtle. As the voltage rises, active devices come into their linear range and their quiescent current becomes determined primarily by the ratio of the bias elements. As long as drive is absent or constant, their current draw will remain nearly constant over a fairly large supply voltage excursion.

Gary

>time with the proper battery.

You aren't going to be able to get a GPS and cell phone for a couple hundred dollars. The cheapest GPS receivers are around $400, and so are cell phones unless you roll their cost into a long term service contract. And monthly and per minute cell phone charges will mount up fairly rapidly. By using packet radio, amateur or commercial, you can send position updates on a regular basis without incurring quite as much cost.

DeLorme Mapping and City Streets are a couple of commercial map systems that work with GPS. However, APRS (Automatic Packet Reporting System) is in some ways better. While it lacks the friendly user interface of the commercial products, and it's pre-made map databases are skimpy, you can make your own maps, and it works with local and remote GPS receivers (using packet UI frames for the latter). It also supports other information about the remote sites such as range and bearing data from DF equipment, and arbitary text messages.

However, what many of us want is *differential* GPS. The Coast Guard, FAA, and others send out position deltas from a fixed benchmark receiver that are received and used to correct the reading of the local GPS receiver. These transmissions are either at MF or VHF depending on the system. A special receiver is required, and either a GPS receiver designed to work with differential signals, or a PC that can take the timestamped position reports and reconcile them via software, is used to give a true position. This method removes the deliberate SA jitter, and other error sources such as varying atmospheric propagation factors,

from the position data. This allows much greater precision in determining location than raw GPS alone.

It would be nice if the APRS author would support this mode in his software. Some of us are willing to set up benchmark receivers on the amateur bands. That timestamped data could be used to correct the positions reported by the rover receivers over packet.

[snip]

Hi Dave. Sounds very interesting. I've actually built hybrid couplers before,
and hence this is possibly a means by which I could do it on the cheap. Do you
know where I can pick up the reference you mentioned above?

> I've just purchased a phase shifter to work at 82MHz. Gives 0-360 degree phase
> shift, with a control voltage of 0-15 V. Quite linear. Available from R&K, but

[snip]
Yes please! It's the sort of information that I sometimes need in my line of
work as well.

> Sorry, just read you want it for an antenna. If you want to transmitt, then you
> may run into problems with power for both of these routes.
> How about doing it with sections of 50 Ohm line, one say 1 degree, 2 degree, 4
> degree, 8 degree ... 64 degrees electrical length. By switch in one or more
> sections, you can get from 1 to 127 degrees of phase shift. Use pin diodes to
> switch the lines.

Well, you've provided me with 3 equally viable methods - thanks for your help.
What I'm thinking of is building a phased HF array ... not here, but back home
when I return there in ~10 months or so - I'll have the necessary space. I'm
thinking of running phase and amplitude conrolled signals to each of 8
elements, and hence I can steer the system electrically in azimuth.
Whether I do the mixing / power amplification before or after phase shifting
depends on the most easily realized method of phase shifting: hence, I'm still
in brain storming mode, and all suggestions are most welcome.

Best regards from VK2ENG.

>intervals, which usually works OK. However, you will also hear stations

Actually _more_ efficient than ISB (USB+LSB) because the lower freq cutoff
of most SSB transmitters is 300 Hz, leading to 600 Hz unoccupied on ISB;
if boxcar (sharp cutoff) filters were used everywhere, the upper 300 Hz
of bandwidth of one SSB signal could overlap the unoccupied bottom 300 Hz
of the next.

Everyone should have an idea occasionally... :=)

Well, this is, unfortunately, not a new idea. The similar systems I'm already
familiar with sell for ~$2000, which tells me that they are costing about $1k
for hardware PLUS s/w and R&D.And don't have much markup.

>You aren't going to be able to get a GPS and cell phone for a couple

Actually, if you shop carefully, the DGPS without a fancy display costs $318.
Quantity 1. It's a Motorola VP Encore core modure, and it runs on 5 VDC
(regulated), puts out TTL levels, and can receive RTCM-104S differential
updates with Option B installed (for no cost, I might add!). Further, with
Option B, it will put out the differential correction data, acting as a
reference station, albeit in Motorols Proprietary Binary format. The
developers' manual has the full data format, making translation to the
standard format pretty straightforward.

The cellphone could be the hard part, from a cost perspective. I've not
looked into that, because there aren't too many cell sites near the ranch I'm
where I'm putting GPS's on cows.

Very true. In fact, it's seriously impressed the GIS institute here at Texas A&M (Nice Job, Bob!).

Er. Ah. See above. Differential is getting easier and cheaper. A local ham club could go together, get a cheap GPS core, throw together an embedded PC clone for translation, and broadcast the results on packet. Now, if you want to get really fancy, use carrier-phase to get the roaming units a little smoother, AND incorporate DGPS.

>It would be nice if the APRS author would support this mode in his
>software. Some of us are willing to set up benchmark receivers on

And, of course, if you want to, one can log DGPS corrections over a local area and post-process the logged fixes from the mobile units, to give DGPS corrected data. That's one of the standard methods used today. I don't personally think APRS is the appropriate place for DGPS post-processing corrections...

Where can I get more information about this device and the developers'
manual? This sounds very interesting!
>
>The cellphone could be the hard part, from a cost perspective.

In California, various places are selling the bottom-of-the-line Motorola
portable cellphone for $100, with no activation required. (CA has a law
prohibiting anyone from requiring the purchase of cellular service with
a phone. However, you do get a VERY nasty look from the salesperson
when you say "No, I just want the phone.") It's almost getting to the
point where it's worth investigating what it would take to put one of
those phones on the 900 MHz ham band.

Incidentally, one of the earlier posters in this thread mentioned tracking
vehicles using the GPS/cellphone system. We had a demonstration here a
couple of months ago in which a ham put a GPS/APRS system in his wife's
car, and produced the resulting map for the local packet users group. The
map provided an every-two-minutes location for the car for an entire
day.

* INTRODUCING 'FAISYN' FILTER SYNTHESIS PROGRAM FOR MSDOS *
* *
*****************************************************************
```

faisyn20.zip Electronic Filter Synthesis Program

FAISYN is a low cost, effective alternative to expensive commercial filter synthesis packages. The program has be used to design lumped element filters and diplexers from 10's of KHz to 1.5GHz and is the result of many years experience in filter design. Designers know that filter design is often an iterative process. Tedious number grinding is sometimes required to optimize a design. FAISYN eases the burden by allowing the designer to quickly synthesize a variety of circuits that can be simulated and compared using your favorite circuit simulator (FAISYN currently supports PSPICE-TM Microsim, MMICAD-TM Optotek and TOUCHSTONE-TM HP/EESOF circuit formats).

Special Requirements: None

Shareware.

Faisyn was developed by:

Kevin Faison
Carriage House Engineering
16 W. Pleasant Hill Rd.
Owings Mills, MD 21117

You can get FAISYN20.ZIP from one of the following sources:

1. I just posted a UUENCODED version (2-parts) to comp.binaries.ibm.pc

2. I have just uploaded the program to the SIMTEL collection. It should appear there, and on it's mirrors soon in /msdos/electric.

3. I tried to upload it to bode.ee.ualberta.ca, but for some reason it appears to be down today. Look for it there soon.

10.7 MHz and 4.5 MHz (TV IF) should be readily available. I bought some
from Rat Shack several years ago, but they don't handle them any more. I
would guess just about any freq could be custom ordered, in quantity.

I've had some replies from regen receiver enthusiasts, seems like they
like 'em. But with the performance so good from relatively inexpensive
receivers nowadays, it would be hard to match them with a simple circuit,
no matter what it did. I ran across something recently in one of the
mags. It was a simple SW recvr using a NE602. I remember they were a hot
item when they first came out. Maybe a receiver using one would be
adequate and have acceptable performance.

Hello I found this mod in the HTX-202 mod file on a CD.
I had this same Problem using a 10v battery pack, But using the External
power Jack on the Top of the Radio and the "Rubber Duck" antenna
this problem never acured. What I found was that the Higher power resulting from
this pack was somehow getting into the Radio thru the battery terminals.
The best solution to fix this would be modifying the Radio, But for a
tempary fix since I only have one Higher voltage battery was to put a
.001 uf cap across the terminals and a ferite bead on the + lead inside
the battery. This solved the above Problem 100%
I hope this helps with anyone having this same problem. GL 73's de WC9C

Hi Ben,
If you can find an old tube type low band (40 - 50 mHz) two way radio,
Motorola, GE, etc, the final amp could easily be moved to 6m. These are
class C amps however if that will work for your application. Ham swap meets
are generally a good place to find these type radios.

Good luck!

>a 12AX7A, the S meter went down. I swapped it with another 12AX7A (tx circuit)

Hi Ed,

Typically the IF amps are pentodes, 6CB6, 6AU6, etc. and the first place to look for oscillations is screen bypass caps (as other posters have mentioned). If the caps were shorted the IF gain would be very low....not the problem here. Try grounding each IF amp screen grid with a .01 @600v disc cap (careful! there is hi DC voltage here) and see if the oscilation is reduced or eliminated. If so replace the cap. Also, tubes can get gassy and cause all kinds of strange problems. The best bet for checking gas is replacing the tube with a known good one.

Good luck!
Mike

All TNC's fit your bill pretty well. They all run off a serial port, and
contain a microcomputer to handle most of the overhead. MFJ, Kantronics,
Tiny TNC - all will do what you want.

A friend of mine had a similar experience with a HW-101 which was sitting in a garage in Florida for many years. It was full of dirt and cobwebs. He took all the tubes out and put it in a dishwasher and washed it then rinsed several times. After drying, he replaced all the tubes, cleaned the volume control, etc and the unit fired right up. Don't know if this will work for you, but it did for WB4ZZB.

2263. Modify an old cellphone to 902-928 MHz?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-14 20:33:06 UTC
From: cs684@cleveland.Freenet.Edu
Message-ID: <32lv23$oqq@usenet.INS.CWRU.Edu>
Source record: 116701

I found several old (1985) cell phone units that were designed to be mounted in the trunks of cars, similar to mobile radios. They were manufactured by Novatel Communications, LTD, in Korea, with an FCC ID of: BFC8J7VTR-2881. Power required is 13.6 volts and claimed output is 3 watts. Size is 11.5" x 10" x 2.75". Inside, the antenna feeds an 800 MHz duplexer which is connected to a power amplifier unit and a receiver unit. Both the power amplifier and receive units seem to connect to a frequency synthesizer (?) board. Underneath all of this is the logic\CPU board which has the ESN PROM, which, I guess, controls the frequencies, etc. The whole thing is built like a tank out of aluminum and all of the RF modules are entirely separate and shielded very well.

I would like to attempt to tune the boards to work at 902-928 MHz FM, and\or, using one of Down East Microwave's transverter units, drive the amplifier to 6 watts or so for 902.1 MHz SSB with 144 MHz as an IF. (Assuming it's linear!)

If anyone has info on a source of schematics, data, etc. or has attempted a similar project, I'd appreciate hearing about your results.

Telephone GEC Plessey semiconductors on (408) 438 2900 and ask them about availability of the GP1010 and GP1020 ICs and GP1010 evaluation board. The GP1010 is a receiver on a chip (just add clock and sprinkle lightly with passives) the GP1020 is a correlator that decodes the spread spectrum signal. You will need to design and build your own interface to your development PC of whatever though.

As for information about signal structure etcetera, go to your library and look for anything by J.J.Spilker, issues of GPS world and (unlikely in the US) copies or Electronics World (UK publication) for about 18 months ago. If you can get the annual report from the Institute of Navigation (ION) so much the better. An excellent introduction to GPSs. As for GPS resources, well, there is a GPS UseNet group (can't recall off hand exactly what), but that is mainly uses of GPS and reviews/opinions of particular devices.

If you wanted a 10w solid state amp, you could base it on the 2sc3133. ICOM uses it in an older 6m rig (IC-505) and the transistor is not too expensive. The ICOM rig is an all mode and with that transistor puts out about 10w from a 12V supply.

Chris,
I don't know of another board based on the 'C56(?). There is another
processor in the C2x family called the 25-50 (50 mhz). You can get
information and programs from ti.com in the directory /mirrors/tms320bbs.

I have ported the sample loader to linux, and am looking for source to an
assembler to use under linux. If you run across the source to an
assembler, drop me a mail.

The part number of the board that I have is TMDS3200026. I purchased
mine in December of '93. I just now have gotten the time to play with it
some, and it is fun.

N-Joy!

Hello,
I am a cadet at the US Air Force Acamemy and I am doing a project this semester where we will launch a hybrid rocket. I am in charge of getting telemetry from this experimental rocket. Being as it is a college project we can't afford expensive telemetry systems.

What I need to know is if there is a cheep way to make an alternative system to send and receive data from sensors(temp, pressure, velocity, g's etc., in a digital form(is there such a thing as digital sensors.)) and then putting the info into a pc for analysis.

Any info or a place to start would be greatly appreciated.

Thanks,
Bill

From: ao859@FreeNet.Carleton.CA
Message-ID: <CuKw9p.IHK@freenet.carleton.ca>
Source record: 116713

Anyone aware of the possibility of modifying a radio shack htx100 10m

to work on lower sideband as does the Uniden. I have heard these

to radios have common controllers. I have looked at the possiblity

of moving the injection in the HTX however this might be acheived

using the proccessor/pll.

I would appreciate any hints or the possibility of obtaining

copies of the uniden 2500 schematics/serice manual.

The reason for this is using the 10m set through a transverter to

go through the invertin transponders of oscar 10/13 ie LSB up to

USB down.

From: dmb@abacus.demon.co.uk
Message-ID: <CuL0DF.1Ap@abacus.demon.co.uk>
Source record: 116714

After a year of stop/start, I've completed my latest rx. When the great day arrived, I connected the power, the S-meter bipped a cheery welcome, and the world was filled with a deafening silence (apart from a bit of hum thru the speaker from the power supply).

Now I'm preparing to trace thru the connections, re-check the transistor/diode/chips in case any slipped thru the wrong way around, check polarity on electrolytics etc. and generally trace the circuit to check for bad joints, incorrect/missing connections etc.

However, it's occurred to me that although this has to be done anyway, there might be a way to identify where the fault is likely to be, by checking the circuitry in modules. It's a supherhet with 2 IF stages. So the fault(s) could be in any of the following:

RF amp, antenna trim, VFO, mixer, BFO, product detector, IF stages, CW filter, audio amp, S-meter circuit, or power supply.

Can anyone suggest anything that might help in testing any of these ?
e.g. "to test the VFO, power up, and check that the output is (high/low/dead)" or whatever ...

Usually, the best method to troubleshoot a receiver is to start with
the power supply. If all the voltages are present, then do a binary
search. Signal injection and tracing are the methods to use. Insert
an audio signal at the top of the volume control and listen for output.
If you get a nice clean tone, move to the IF and inject a signal there.
If, OTOH you don't hear anything, inject the tone (higher level) at the
audio output amp, etc. Divide and conquer until the problem is isolated
to a single stage, then component level troubleshoot from there.

Interesting that you bring that up. I once bought an MFJ RTTY demodulator.
The schematic was obviously copied from the ST-6 demodulator that appeared
in Ham Radio Magazine in the early 70's, except they had "modernized" it
with active mark and space filters, replacing the original 88 mH. toroids.
Now it just so happens that I once built a real ST-6, and there was no
comparison between the two. My unit with toroids had much better selectivity
than the MFJ, which was inadequate for 170 shift.

Did MFJ screw up their active filter design? Well, they're not rocket
scientists down in Mississippi, but it's really a problem
with trying to get too high of a Q in an active filter. It turns out that
it is damn hard to build a manufacturable high Q active bandpass filter,
no matter how much you know about filter design. A 50 cent toroid is far
cheaper and better.

If you insist on doing it, build a state variable filter with adjustments,
and adjust it! Be sure to use 10 MHz. op amps like 5532's, not 1 MHz.
op amps. And use plastic (mylar) capacitors, not ceramic. I shouldn't
need to remind you to avoid carbon comp resistors.

: Does anyone know how you configure a Sound Blaster 16 (with an "ASP") to
: do real-time processing of audio signals. What I mean is taking audio
: input from its a/d, manipulating it, and presenting the output on its d/a
: converter immediately. It seems to me that they have designed the
: hardware to be able to do this, but I can't find anything in their
: documentation or on the Creative BBS which describes how to do this.

: By real-time, I mean processing of audio on the fly WITHOUT saving it to
: disk. Examples of such processing would be lead vocal cancellation
: (channel subtraction), surround-sound, and adding echoes.

On a local software archive I found a program which uses a SoundBlaster (type unknown) to perform an FFT, then look for a tone and decode it as morse. The program is stored as fftmorse.zip; the copyright notice is 1992 and the program was written by:

Fran&#xFFFD;ois Jalbert (jalbert@IRO.UMontreal.CA)

The C source code for the program is included and the .doc file includes a good desciption of the code and the FFT implementation (DFT actually). If you can't find the file on your local PD archive I can probably mail it (it's only 27k).

It has also been said that narrow audio filters of the LC (toroids) or
other inductors have less ring and are easier on the ears than active

filters.

Jeff-

I don't have my notes handy, so the following may be a bit "flakey"!

As far as I can tell, all you have to do is warp the HTX-100's USB crystal so it is on the opposite side of the IF filter, and you will change to LSB. I recollect that there may be a fixed capacitor in parallel with the adjustable capacitor used to calibrate the frequency. By changing the parallel capacitor, you may be able to move the frequency, and keep some adjustability. It only needs to move about 3 or 4 KHz.

If you were to come up with a potentiometer-controlled voltage variable capacitor arrangement with sufficient range, you might not only change sidebands, but would have a tunable IF. This is essentially how the Kenwood TS-430's IF bandpass tuning works, except it has very limited tuning range.

This IF signal is both up and down converted by the same local oscillator, so its frequency won't affect the over-all transmit frequency. (It has been noted that most of the Uniden radios, which includes the HTX-100, come aligned between 100 and 200 Hz low, as if they were all set by the same bad counter!)

A pair of cheap IRF511's (about $1 each mail order from the US) in push-pull arrangement with a 30 Vdc supply voltage will give you 30 to 40 W RF out with about 2 W RF drive on 7 MHz, and about 50 W on 3.5 MHz; see RSGB Radio Communications Tech Topics March '91. You can really work the IRF511's hard if you have an effective heat-sink. By cutting rectangular holes in the circuit board, it is possible to mount the devices direct to chassis (with suitable insulating h'ware) thus obtaining a really effective cheap heatsink.

Also see Rad Comm Tech Topics for May '90, where is described a push-pull/parallel arrangemet of VN88AFD devices powered from a 35 V supply yielding 50 W RF output.

> subcarrier carrying an L-R signal added to the baseband L+R signal.
>

Yes, L-R is used to DSB-modulate the 38 kHz sub-carrier. A phase-related 19 kHz pilot tone is added to the signal, as well as L+R, and the resulting composite signal is used to FM the carrier. The 19 kHz pilot tone is doubled by the stereo receiver to provide the re-inserted in-phase 38 kHz sub-carrier needed to detect the L-R component in a product detector. Then, an audio matrix resolves L and R channels by L = ((L+R)+(L-R))/2; and R = ((L+R)-(L-R))/2.

Hi,
I am interested in how I can supply power to a circuit without the need for any physical contacts. I thought that I could have two coils. One would be connected to an AC source (the transmitting coil), the other coil (the receiving coil) would be connected to my circuit. I would then have a bridge rectifier on the output from the "receiving coil" to provide DC for the circuit.
Can someone tell me if this is practical? How should I go about constructing the coils? Are there any references anyone know of on "wireless"power supplies?

Best Wishes,
Henry.

Now TWICE the number of outdoor Tailgate spaces are available...

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

FLEA all SUMMER at MIT
August 21st, 1994
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $2 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

!! RAIN or SHINE !! Have no fear of rain, a covered
tailgate area is available for all sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

This is presumably something like the Baycom packet modem. I built one
and it works fine. It is basically a very simple 1200 baud modem that
is self-powered by a PC serial port. All the packet stuff that is handled
by the Z80 or whatever on a conventional TNC is done by software running
on the PC itself. There are similar packages using the same modem for
other systems like Macs and Amigas. Ramsey supply a kit for the PC.

Re the recent query, you might want to write (with SASE) to Ed Wetherhold, W3NQN; I don't have his address handy, but he moved a few years ago across town in Annapolis and his current location is on Catlyn Ave (ie, use a fairly recent callbook!) He has had quite a few excellent articles on filters over the years in a wide variety of amateur and trade and professional journals, and also the ARRL Handbook. He has been providing used telephone company toroids for years; they are supplied free for amateur use (you pay shipping only), through an arrangement he has with a local phone company. I assume the offer still stands. He also sells, at reasonable cost, the various components needed to build up some of his audio filter circuits; this included MATCHED capacitor sets--he laboriously sits down with a capacitance meter and makes up batches of caps--since some of the values in the circuits are odd ones, he solders two caps together to get the proper value, and that takes a lot of time. For what he charges forthe matched sets of caps, it's a bargain any way you look at it. I tried two of his filter designs for CW, one 534 Hz and the other around 750 Hz, and the response was unbelievable! You have to hear them to believe them. There is some loss, of course, about 3 dB, but a small price to pay for the incredible selectivity. 73...

David Byrne London, UK (dmb@abacus.demon.co.uk) wrote:

My usual procedure is to build stuff circuit by circuit,
testing each stage out as I finish it. A circuit is
defined is something that I can test :-). It helps to have
a signal generator/spectrum analyzer. Not as nice but almost
as useful is an amateur transceiver.

Generally, the less test equipment you have the more you will
have to rely on ingenuity. For instance, one way to
align a gunnplexer's circulator is with a noise figure meter.
However, the results (mixer current) was almost identical to that
obtained by listening to a weak signal across a room.

MMICs might be used as inexpensive NF standards. Unless you are
trying to tweak out better NF with input matching or using a 6 GHz
one at 10 GHz, they are usually pretty close to data sheet numbers.
Thus, you might test out your hot new preamp/IF amp against a MAR-6 up
through 1296 and against a MGA-86576 (2.3 to 5.7 GHz).

Asuuming a low data rate, a simple Audio Frequency Shift Keying modem and a simple TX RX pair should do the trick.

First, pick an audio TX and RX radios for communications. Hamtronics makes some cheap ones in a number of different frequencies. I imagine a small antenna is optimal, so you should look at 400 MHz or 900MHz.

Second, build a modulator. A XR2206 is a simple single chip solution. It takes a digital input and outputs a true sine wave.

Third, build the demodulator. A PLL, like the 5WHatever from national work like a charm for a simple demodulator. In fact a basic design is in the data books.

Now you hook the modulator to a microcontroller's serial port in the rocket, and the demodulator to the PC. All the timing is already done for you.

Good luck and 73,
Shawn KE4GHS

PS: Be careful in choosing keying frequencies and data rates.

John, there are several solutions. The commercial approach is to use
a pair of gas discharge tubes on the balanced line to ground. For
receiving, NE-2 bulbs are commonly used (though they can become noise
generators in themselves). For transmitting, proper tubes are available
from Polyphaser that are self quenching. Along with a proper grounding
system, this latter approach will provide lightning protection as well
as static drain.

Another simple approach is to use a carbon resistor, 10k or greater,
center tapped on the balanced output coil to ground. If the antenna
system is well balanced, no signal will flow in this resistor, but
static charges will be drained off the antenna.

A choke can be used here as well, but care must be taken to make sure
it offers no self resonances over the band of interest.

These latter two approaches offer little or no lightning protection.
Therefore you should install a DPDT knife switch at the entrance
point so you can disconnect the feeders and ground them during periods
when you aren't operating.

>More to the point- where and what value RF choke could be used in such a
>set up?

My favorite method is a DPDT knife switch located at the entry point into the house (usually a window) with each side of the balanced line grounded through the switch when not in use. I'm not sure where one can obtain a suitable knofe switch these days; mine has the two poles spaced properly for 450-ohm balanced line, with brass contacts and a porcelin base; I've had it for 30 years.

I'll check my NAB Engineering Handbook for static drain choke parameters and get back to you; used to use one at the AM station I was CE of in the '70s, since our 400' tower was series-fed and thus ungrounded. We did have a problem with the static drain opening up due to fairly large currents generated when thunderstorms were in the area, so as a rule of thumb I'd suggest something with a high current rating (such as a high-power transmitting choke). 400 mH will give you a reactance of about 4500 ohms (10 times the feedline Z) at 1.8 MHz, but that's a pretty large choke, especially if it's wound with large wire. Try playing with some numbers (I'd suggest not using less than 5 times Z for the reactance at the lowest operating frequency) and see how that compares with what's in your junk box and/or otherwise available. Remember that you'll need two, one for each side of the transmission line. I'd recommend installation at the building egress, with a direct heavy ground connection to a buried rod.

Hi,
I have been interested in the concept of ham radio for a while now
but have not done anything about it except buy a book(and tape) that helps me
learn the morse code. But I am interested in the following things:

1) Getting a ham radio license.

2) Making (from a kit, perhaps) a radio transmitter capable of
transmitting relatively long distance (a few thousand miles).

I have never even soldered a wire to a board. So, I have the
following questions:

Is it feasible for me to attempt #2 above?
How much is it likely to cost?
What should I expect to pay for similar equipment if I BUY it outright?
Are there any pitfalls I am overlooking in attempting to build an amateur
station rather than buying it? In other words what are the pros and cons
for a beginner?
I don't know if this is the appropriate news group for this
particular question, but what is the procedure that I need to follow
for getting the novice (?) license? I do have this book but it is kind
of old.

Well, thanks in advance for all your advice and help.
I would appreciate email responses to : gulu@engpub1.bu.edu

Gulu.

This is a common way to get power across a short distance.
Applications include recharging pacemakers, recharging electric buses,
and recharging electric cars. The basic idea is to build a split
transformer.

What distance did you have in mind?

Isn't this a job for an isolation transformer, or do the two coils have to be
far away from each other ?

It sounds like a 1:1 transformer will do the trick...

I know of five TNC2 clone designs available in the UK, or you could ask
TAPR if they still do one themselves. By using one you have the
advantage of being able to run all sorts of different bits of software
depending on your current fancy. Be careful about which modem chip a
particular design uses though, because it appears that the 7910 is being
discontinued.

No - most of the construction articles would be for RTTY terminal units, and pretty old now. Other than some of the now outdated packet-only controllers offered in the mid 80's, there have not been any construction articles I know of for an intellegent data interface. The closest you would have been likely to come was Heathkit's HK-232 clone of the AEA's PK-232, offered as a kit. Heath has been out of the kit business for about 3 years now, so unless you find someone who got a kit and never started it, you're pretty much out of luck. Part of the problem is that the companies that make the multi-mode TNCs have invested lots of money in the programming of their products to support the various modes, and are not interested in giving away their efforts. Also, since these are tightly integrated hardware and software products, the software wouldn't really work on anything else.

I have seen programs mentioned for non-intellegent interfaces usign a PC for the processing, as I'm sure you have, and that, combined with an older dumb modem or terminal unit design is going to be your best chance to get something going that you build. Even with the inexpense of used PC systems to dedicate, its usually not cost effective as compared to one of the commercially manufactured products.

Good luck in your search.

>Mike, KK6GM

Books of the "Active Filter Cookbook" genre (just bought a copy at the
flea market over the weekend!) tend to recommend circuits such as
Sallen-Key negative feedback which require a gain bandwidth product
in the op amps proportional to a constant times Q^2 times the center frequency.
An RTTY mark filter at 2125 Hz. with a Q of say 25 yields a required
bandwidth of the constant times 1.2 MHz. The constant is typically 9
which gives you over 10 MHz., and that's the minimum. Operating just
over the minimum makes the circuit extremely sensitive to the op
amp temperature and voltage and in any case, it will have to be
trimmed back to the right frequency and Q. You really should be
using something like an OPA620 with 200 MHz. GBW product. Some
designs also have problems with magnifying component value errors,
where a 1% resistor error will move the center frequenc
10% or more. Another problem is spread of component values.
Many popular designs have a spread of 9Q^2,
meaning for a Q of 10, the biggest capacitor is 900 times the
smallest one.

I guess in summary I would say that building filters is harder than
it looks in the books if the Q is more than 2 or 3, and even that
Q may be non trivial if the frequency is very high.

>Thanks.

Well, I haven't seen any kits or construction articles exactly. But the
TAPR TNC-2 bare PC board and the excellent manual and circuit charts
that come with it are, last I heard, available from TAPR for $40. No,
not cheap, but a nice PCB. The TNC-2 has been a defacto standard,
it uses a Z-80 CPU and Z-80 SIO/0. If you build it up with new CMOS
parts and all, you'll probably spend as much $$ buying a KPC-3.
However, you'll learn a lot and it is quite functional. The TNC-2
uses a Exar XR-2211/2206 chipset for the modem, you could leave this
off and build your own modem using a TCM3105, Am7910 or 73K302, all of
these have the advantage of crystal controlled tones rather than the
XR-2206 variable resistor method.

You can also roll your own; design a Z-80 CPU with Z85C30 SCC and 32k
each of ROM and RAM, and build it, and write the software. Yeah, it sounds
daunting, but you'd learn *everything* about AX.25 packet in the real world.
For a modem, the TCM3105 is a popular 1200 baud modem with low current drain.
The SSI 73K302 (I think) is a nice Bell 202/103 modem, but it requires more
effort to interface than the TCM3105...

Have fun!

From "Handbook of Electronics Tables and Formulas", Howard W. Sams

26 AWG copper wire, recommended current ratings (continuous duty)
Circular mils: 254.1
Resistance per 1000 ft (100deg C): 45.2
Maximum current: Free air: 2.2 amps
Confined: 1.3 amps (confined=bundle of 15 or more wires)

[no distinction was made between solid and stranded wire]

: >
: >Mike, KK6GM

: Books of the "Active Filter Cookbook" genre (just bought a copy at the
: flea market over the weekend!) tend to recommend circuits such as
: Sallen-Key negative feedback which require a gain bandwidth product
: in the op amps proportional to a constant times Q^2 times the center frequency.
etc, noting that the required bandwidth of the amps gets pretty large,
and the component sensitivity can be very poor.

There are other circuits that do a lot better. Have a look at state
variable filters. However, you'll end up using lots of parts to
implement much of a filter: a couple good caps, some resistors,
three or four op amps, and support stuff like bypass caps, just for
a pole pair. You can also get into switched capacitor filters,
which often are state-variable configuration for the general-purpose
ones; you can also get high-order lowpass filters in small packages
that require few support parts. Aliasing is a problem, as is noise
if you want it really quiet, though you can do better than 60dB
fairly easily.

But if you want much of a filter, I'm convinced that DSP is the way
to go: A stereo A/D-D/A chip and a DSP and PROM and darned little
else will do a very nice job. The DSP code can take a bit of time
to get right, but you end up with a filter that stays put. You
have to be careful about keeping enough bits around: sometimes
double precision is required to prevent strange limit cycles. But
for example, I'm currently doing 32 poles of filtering, all
double precision, on a 20kHz bandwidth signal (digitized at about
45k samples/sec), with an inexpensive DSP with time left to do
some other calcs as well. Could probably do 40 poles if that was
all that was required. This is on a credit-card sized board.
The filter cutoffs are configurable. Really tough to do with
op amps in that size, and forget about approaching the DSP
stability and accuracy.

: subcarrier carrying an L-R signal added to the baseband L+R signal.

They're actually the same thing (minus the pilot tone). If you alternate the two audio channels so that each side gets 1/2 * 1/38000 second, the ripple between the left and right comes out equivalent to a DSB modulated 38 kHz signal. Coming up with the necessary low pass filter that didn't mess it up could be nontrivial.

Mike, KK6GM

If you want to build cheap, good performance audio filters, I think you should consider the various switched-capacitor filter chips. For example, National Semiconductor makes several different chips of this kind, all for very reasonable prices, that are very easy to use and require only a few external parts. Last year I built an 8th order bandpass filter using these chips (from a QST article). The filter performs better than any active audio filter I have heard, and the cost was very reasonable: an active filter would have cost about the same and perhaps not performed as well.

On the other hand, if you're willing to spend a little more money, I agree with the person who said DSP is the way to go. DSP audio filters are unbeatable by any other technology, and additionally a DSP filter can implement other KINDS of filters that can't be (practically) implemented in non-digital hardware: such as the adaptive filters that do such a nice job eliminating heterodynes and noise.

I seem to recall this method of cleaning was discussed at some point in
one of the ham radio newsgroups. I think someone pointed out that some
kinds of dishwasher-type soap can be harmful. I don't recall whether it
attacked components on the circuit boards or what it did. Maybe someone
else remembers what the problem was. Something to think about though.

Maybe plain water in the dishwasher (no soap) is "safest". I put "safest"
in quotes because this method is certainly not safe if your wife
catches you putting radios in the dishwasher! ;^)

Im rebuilding the phaseing delay lines for my KLM amateur satellite yagis and need to located a source to acquire about ten feet of RG-302 75 ohms and ten feet of RG-303 50 ohms, teflon coax cable.

RG-302 & RG-303 both have teflon dielectric and a silvered copper shield, both have inner conductors of silver-plated copper-plated steel. They are designed for high-temperature operation. I suspect they were selected by the antenna manufacturer because of low temperature coefficients. I don't want to use Radio Shack 75 ohm TV cable.

Different velocity factors between teflon and polyethylene.

polyethylene = 66.5% teflon = 69%

KLM sells the complete phaseing kit replacements for $49 each, however I feel I should be able to replace just the coax for at least half that price.

If anyone knows of a source for RG-302 & RG-303, please post here or reply via eMAIL direct.

Thanks and 73s,
Tom - WB7ASR... (not speaking for Intel)

Source record: 116567

It's been over 15 years since I've designed any active filters, but I seem to recall that the voltage across the feedback elements will be multiplied by the Q of the network. This implies that a high-Q section will of necessity have a limited dynamic range. For example, many of us would consider an input audio level of 1 v rms "ok", yet when one factors in the peak-to-peak levels times the Q of the section, we see that limiting is sure to occur with +/- 15 volt supplies on the op amp. This would be worse with 9 volt batteries, or single polarity configurations.

Just my two cents worth.

I don't understand the tube requirement. At this power level a transistor amp is a natural. It would be much more expensive to build a tube amp, considering power supplies, etc... 12V supplies are cheap. How about an older solid state low band rig. Pull a class C amp off of a Mocom/Micor/MastrII - it could be easily moved to 6M. You would end up with anywhere between 5-100 watts, depending on model. Get one at a hamfest near you for $20, maybe? Get a service manual, and have fun.

> ceramic IF filters these days....?

Michael & John-

My first Ham receiver was a Boy Scout Short Wave Set, which was a regenerative receiver using plug-in coils, battery power and one or two tubes. I made a number of contacts on 40 Meter CW using that receiver and a one-tube (6L6) transmitter. Of course you're right about the selectivity. However, what made the regenerative receiver so special, was the amount of gain available without extra stages of amplification. The trade-off was simplicity versus tuned stages.

In actuality, the term, regenerative, refers to the detector. I see no reason why a regenerative detector couldn't be used in a superheterodyne configuration, to take advantage of the selectivity. However, doing so would offer no practical advantage over use of a BFO or product detector, since other stations within the bandpass tend to "pull" the regeneration frequency.

This discussion started with "regenerative sets", which were used for CW. The "super-regenerative" receiver (detector) should also be considered in the discussion. I never understood how they worked, other than regeneration was increased far above the amount used in ordinary regenerative receivers. I suspect they might be useable in a superheterodyne configuration.

I've seen ceramic IF filters and discriminators used in less expensive NBFM communications receivers, including much of the Two Meter Ham gear on the market. Their advantage is that they require no tuning. The only tuning problem might be incorrect impedance matching at either the input or output of the filters, which could cause "ripple" or skew the shoulders of the bandpass curve. They are usually considerably smaller than equivalent LC filters, and cheaper than crystal filters.

One drawback of ceramic IF filters, is that the ultimate out-of-band rejection may not be as good as can be achieved with other filters. It may also have more insertion loss. However, insertion loss isn't usually

a problem with an FM system, where noise figure is determined in the front end, and the detector is preceded by limiter amplifiers.

: >time with the proper battery.

: You aren't going to be able to get a GPS and cell phone for a couple
: hundred dollars. The cheapest GPS receivers are around $400, and so
: are cell phones unless you roll their cost into a long term service
: contract. And monthly and per minute cell phone charges will mount
: up fairly rapidly. By using packet radio, amateur or commercial,
: you can send position updates on a regular basis without incurring
: quite as much cost.

: DeLorme Mapping and City Streets are a couple of commercial map
: systems that work with GPS. However, APRS (Automatic Packet Reporting
: System) is in some ways better. While it lacks the friendly user
: interface of the commercial products, and it's pre-made map databases
: are skimpy, you can make your own maps, and it works with local and
: remote GPS receivers (using packet UI frames for the latter). It also
: supports other information about the remote sites such as range and
: bearing data from DF equipment, and arbitary text messages.

: However, what many of us want is *differential* GPS. The Coast Guard,
: FAA, and others send out position deltas from a fixed benchmark
: receiver that are received and used to correct the reading of the local
: GPS receiver. These transmissions are either at MF or VHF depending on
: the system. A special receiver is required, and either a GPS receiver
: designed to work with differential signals, or a PC that can take the
: timestamped position reports and reconcile them via software, is used
: to give a true position. This method removes the deliberate SA jitter,

: and other error sources such as varying atmospheric propagation factors,
: from the position data. This allows much greater precision in determining
: location than raw GPS alone.

: It would be nice if the APRS author would support this mode in his
: software. Some of us are willing to set up benchmark receivers on
: the amateur bands. That timestamped data could be used to correct
: the positions reported by the rover receivers over packet.

: Gary

Hello,

Does anyone know what the pin configuration is for the
connector on an Astatic Silver Eagle microphone? I'm planning to
modify mine for use as a desk mike with my 2m radio, but unfortunately lack
the pinout diagram. Any assistance will be greatly appreciated.
Replies can either be posted to this newsgroup or sent to me directly.

My address is: smalley@pilot.njin.net

Thanks in advance,

John V. Smalley

Source record: 116626

It seems that I have started a new thread of discussion. I had made the plea that those wanting e-mail returns include an e-mail address in the text of the message. I now know why!

Some of us read the news groups only in digest form (i.e. we get a big glob of messages as one mail message). The software that does the digesting sometimes removes the sender's address. I have seen several people's messages whose last entry in the routing is not-for-mail@network.ucsd. This is obviously not very helpful in replying to someone!

Of course, those of you who get the messages directly don't have this problem in making direct replies.

While I was at the local electronics store I saw some 88mH toroids made by Amidon. I was really surprised to see a BRAND NEW 88mH coil. The only ones I had ever seen before were surplus. Anyway here is the address from their ad in QST:

Amidon Associates
2216 E. Gladwick St.
Dominguez Hills, CA 90220

(310)763- 5770

You may be able to find them locally too!

2344. VFO drift questions

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-18 14:46:51 UTC
From: randolph@est.enet.dec.com
Message-ID: <330a7b$iq3@mrnews.mro.dec.com>
Source record: 116634

I'm building a 40m copy of W1FB's "universal VFO" as seen in QRP Notebook. I have the actual oscillator itself running, no buffer stages yet. About how much drift can I expect out of one of these before I get it closed up in some kind of box? I found that I can blow on it and get it to drift by a couple of hundred Hz, presumably due to cooling/heating...

Description for those without the book: Hartley osc., #6 material toroid and NP0 caps, MPF102 JFET with 9V supply regulated by a Zener. I cheated a bit and used a cheapo trimmer cap in the osc. (Mouser's "6mm snap-in mount", listed as N750). Should I fork over the $3 for the air trimmer?

Ken,
If you have the ARRL Handbook, look under Component Data for
such things. 24 AWG wire (solid) can handle about .5 amps so stranded
should be able to handle just under that.

If you wish, I'll dig back through my old ARRL Handbooks and VHF
Manuals and see what's there; copies are free if I find anything of
potential interest.

I ran P-P 6146Bs on 6 and another pair on 2 during the 1970s,
CW & SSB. Worked as well and seemed as clean as anything else around
at that time. However, a word of warning: My Dad, WA4CVA (now SK)
ran a Clegg Venus which has about as clean a 40-watt signal as ever
I've seen on 6 (I ran spectral measurements on it) and he still had
TVI problems; front-end overload and "rusty bolt" effect on a TV
across the street from him with a crappy, unmaintained antenna and
an old, unmaintained set; and cable TV interference two blocks (!)
away because the cable company used unshielded amplifier housings.

The point is, a very clean amplifier does not guarantee that
you won't still have problems with TVI. But, it's a necessary first
step, IMHO, so your concern is commendable.

Also check old copies of Ham Radio magazine. I have an old 826 tube that
came out of an ultrasonic cleaner that will put out 90 watts up to 150Mhz.
Specs for it are in the old Handbooks. The trick is to find a design that's
close to what you want and then modify it to match what's available.

>Maybe plain water in the dishwasher (no soap) is "safest".
[...]
>keith@radio.nl.nuwc.navy.mil

If it has any plastic parts, be very careful. At the end of the wash, many dishwashers turn on a heating element that has ruined many a plastic article in ours. Since a HF rig is not something you casually put in the dishwasher and go watch TV, I suppose this is not too much of a problem to remember to remove it!

I would think that meters might suffer from leakage and water moisture build up.

But then again, as in some equipment, if you have nothing to lose, then why not. I know some people that have disassembled hard disks in their "non-clean" basements, and put them back into service successfully. So, who knows whether a gamble pays off or not?

Actually, come to think of it... why not put the TUBES in the top rack? Get them all nice and spiffy clean... they're least likely to suffer from it, assuming they can't move much!

- * -

I can just imagine what my XYL's reaction would be... opening the dish washer and pulling out the top drawer full of tubes (snicker)...
...then pulling out the bottom drawer with the old boat-anchor (rig) sitting on it!!!

Then the side tray where the silverware normally goes, I could leave my favourite pliers, screwdrivers, and open-end and box-end wrenches.

Ah... that would be fun... even if it meant the dog house for a week.
A Kodak moment... good footage for America's funniest videos.

> Can someone tell me if this is practical? How should I go about constructing
> the coils? Are there any references anyone know of on "wireless"power
> supplies?
>
I designed and built a waterproof flashlight with a recharging circuit that
was powered by induction. The charger was a transformer coil squashed flat,
with the secondary coil removed. The transformer was originally a 120 to 12
volts. The flashlight was a large 9volt type with a flat base.
In the base was the secondary coil, the diode, and an led with a resistor.
I replaced the switch with 2 magnetic reed switches and sealed it completly
shut. On the outside, a small magnet would slide between charge/off/on.
It had many drawbacks that I would now change. The major one being a
smart charging circuit that would fast charge then trickle. Also, I would
find a better case and not glue it shut.
Unfourtunately, while scuba diving on my mooring, the string on it somehow
became untied. It was swept away in the current. It vanished in seconds
never to be seen again.

Devices for this frequency are characterised using S (Scattering) parameters. There is a cheap simulator I use, called 'Puff' developed at Caltech. It distributed at cost by Calctech, Elec Eng dept. You can enter the S-parameters of a device, from a data sheet

Many transistor models require measurements to be made of currents and voltages, as one port is shorted or open circuit. These are not suitable, for a number of reasons.

1) Difficult to measure voltage or current, as the frequecny rises
2) UHF/microwave devices will often (usually) go unstable if you short or open ports.
3) Unstable devices will often self-distruct.

S parameters are all measured with all ports in 50 Ohms (by convention).

Using a program like Puff, I've designed stuff at 2.6 GHz without any network analyser. Trouble is you do need a decent knowledge of microwave theory/transmission lines. The problem with the version I have, is that it cant handle anything to do with noise. You can not see the effect on the noise figure of any changes.

The only things I found that made high power on 6 more or less doable in a
channel two area were the Drake TV-300 low pass filters. These things cut
off *SHARP* at 52MHz and had sufficient attenuation at 50MHz that a KW SSB
only tossed herringbones on the screen in a medium to high signal level
channel two area in Detroit. The presence or absense of the dual butterfly
resonator filter I had on the PA had little or no effect on channel 2. I did
figure it was a good thing for harmonic reasons, though. (That filter was
so narrow I had to retune it every 100KHz for decent reception and every
25Khz to 50Khz for decent VSWR. Sadly it was one of the things that did not
survive my divorce. {'_`} Whimper!)

Dig around in the back recesses of local (and not so local) libraries for
1950's to 1960's era _The Radio Amateur Handbook_ editions. Back then 6L6's,
with liberal parasitic suppression applied, was used for transmitters in the
20-50 watt range. (The memories are so dim I cannot nail it down better, alas.)

If you can get your hands on the Motorola data for the MC1648
osc IC, there are a couple of wide-range VCO circuits there,
e.g 10-50MHz and 50-160MHz. Very simple too, though of course
stability and output voltage variation across the range
will leave something to be desired, no doubt! Let me know
if you want further info.

I would wind my own..
88mh,
look up in the ARRL handbook powered Iron cores.
Then the equation to calculate the number of turns for a specific core is
100*sqrt(88uh / Al) Where the value of Al values for each specific core.

Also, the color of the core depicts things like operational freq etc.
You can buy cores from Amidon.. Address, I'm not sure, but they do sell in
small quantities.
Good luck!

I can suggest several books: the Motorola _RF Device Databook_,
Solid State Design for the Radio Amateur, and the ARRL _UHF and
Microwave Experimenter's Handbook_.

The first will give you lots of ideas for transistors and RF modules
that can operate at 100 MHz. The test circuits given may be very
helpful as starting points for your own designs. The second is a
general-purpose book on how to design RF circuits. Its sample circuits
are somewhat dated but it is still useful. It does have some discussion
of VHF design, but it does not go into great detail. The third is meant
for 300 MHz and up, but it may be useful anyway. Get it if you want
information on issues like stripline and tuned cavities.

Of the three, the one that will be most useful to you is the Motorola
RF Databook. If there are RF devices that are easier to obtain on
South Africa, get databooks from their manufacturers as well.

>a Clegg 66'er but they both are runts compared to 40 watts. How many

Not sure, actually. But the Venus was a *very nice* radio and I
wish I had one now. It was large, of course, by today's standards, and
full of tubes on a hand-wired chassis, but it was a very nice 6-meter
transceiver and with the companion Apollo 6-meter linear (500 W?) put
out a VERY respectable signal. Of course, I used it barefoot for a
while with a 2-element quad and had a lot of fun during Es openings.
It had a *nice* Eddystone dial (but no digital readout.....darn! :-)

A method of getting 120 volts to tower lights on AM broadcast
antennas is the use of a commercially available "transformer"
that has an ~4-inch gap betwween a "primary" wound around
a toroid and a "secondary" that is a much larger ID coil.
Imagine two ~10-inch diamter rings "meshed" at a 90-degree angle.
It works like any other transformer except for the big air gap.
Not too efficient, but the RF-to-ground isolation is fantastic.

Hi Tom

The variation of the VFO's toroidal core with temperature will cause drift -
generally large enough to be annoying! :)

When building oscillators I follow some of the guidelines in "Solid State
Design for The Radio Amateur": don't use iron powder / ferrite cores -wind air-
core inductors if possible; mechanically secure all components, as vibration
will cause drift and FM'ing; and numerous others.

I've used Series-tuned Clapp and Colpitts oscillators as free-running VFO's
with relatively low drift (i.e. without a PLL circuit to stabilise them) -
these can be built to minimise the use of iron powder / ferrite.

To test the drift, use a hairdryer (no kidding!). Observe the frequency
with the dryer alternately set to "no-heat" and "warm" for short periods, and
you'll get an indication of whether the VFO will do what you want, or whether
you wish to try re-designing it.

I have uploaded to the SimTel Software Repository (available by anonymous
ftp from the primary mirror site OAK.Oakland.Edu and its mirrors):

SimTel/msdos/electric/
faisyn20.zip Electronic filter synthesis program

FAISYN v2.0 is a low cost, effective alternative to expensive commercial
filter synthesis packages. The program has be used to design lumped
element filters and diplexers from 10's of KHz to 1.5GHz and is the
result of many years experience in filter design. Designers know that
filter design is often an iterative process. Tedious number grinding is
sometimes required to optimize a design. FAISYN eases the burden by
allowing the designer to quickly synthesize a variety of circuits that
can be simulated and compared using your favorite circuit simulator
(FAISYN currently supports PSPICE-TM Microsim, MMICAD-TM Optotek and
TOUCHSTONE-TM HP/EESOF circuit formats).

2372. DME (Dog Measuring Equipment)

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-20 23:28:03 UTC
From: paulbreed@aol.com
Message-ID: <3363i3$7qk@search01.news.aol.com>
Source record: 116660

The Problem:
The dog keeps taking off.
It would cost too much to fence our 2 ac. in the woods,
and he usually takes off when the kids get bored throwing the ball for him
etc..
(So he's not on his chain when the kids are throwing the ball etc...)
Any system that worked could also be used to detect kid snaching etc...

The solution:
Devise a system that would tell me when He was leaving the yard.
The dog carried part would have to fit on the collar of an 85lb
dog.
It would be nice if the battery lasted at least a week.

Idea #1
Build a simple Distance measuring system (Pulse and respond)
Alarm when the dog was 300ft +- 50ft from the house.
+-50 Ft is +/- 50 nsec

Idea #2
Build a set of directional antenna that would detect when he left the
defined perimeter. (Two sets antennas on the ends of the yard.)
An array of antennas could also get some distance information from time of
arivals if the dog was within the antenna array.
four antenas on the corners of the yard?
with coax going to a central box??? (Probably too much coax $$$)

Idea #3
Run a wire around the perimeter of the whole property carrying an ac
signal, when the collar detected the signal it would alarm???
I think there is a commercial system like this.

Questions:
1)Any other wild ideas?

2)What are the FCC rules asociated with low power unlicensed radiators?
What Freqs?
What Power Levels?

3)What kind of antenna could be mounted on a collar that would be rugged
and omnidirectional?
What is used in wild animal radio tags?

4)How does the commercial perimeter system work?
What frequency does it operate on?

I hope the ideas were entertaining,

Thanks in advance
Paul Breed

2375. help with crystal set?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-21 04:54:01 UTC
From: jimcan@aol.com
Message-ID: <336ml9$cp5@search01.news.aol.com>
Source record: 116664

I have just finished assembling my first crystal radio, and it doesn't work. I'll try to explain my situation, and maybe somebody out there knows of a possible problem?

I'm using a design called Telfunken, if that rings any bells. It involves three coils (,which I have made sure are all wound in the same direction). The first is connected to the antenna and the ground (the antenna is two square feet of 15 loops, I think called a "dipole"? and the ground is a radiator). The second is connected to a variable capaciter, and the third to a diode and headphones (I have tried the diode in either direction, and the headphones are of the right type). The number of loops in the coil connected to the capaciter is 80, for the other two 30 (diameter of two inches).

The only possible problems I can think of is that the "ground" isn't really connected to the ground (although I have also tried a sink) or the individual wires of the antenna are not supposed to touch (which would be impossible to correct, because of the kinkiness of the antenna wire-- though I have connected my antenna to a store-bought radio and noticed a definite improvement in clairity) or that the capaciter is not of the right capacitance. The instructions I'm following call for a 365 picofarad capacitor, but in the schematic, they have a variable one. What I'm getting for a result is not static, but no sound whatsoever-- could this be related to improper grounding, antenna, or capacitance?

Thanks, JimCan

Get a copy of QST, then flip through the pages and request a catalog from anyone who offers kits. There are lots of excellent sources. Many of the best don't have 800 numbers or have unusual hours (being perhaps as much a labor of love as a business) so don't pass those by.

Also read here and on the QRP list for people's opinions about various kits. To pick my last kit, I figured out who the experts are on these lists, then paid attention to what kits those experts liked.

> Also, where is the best place to find plans for building such things
> from scratch? Especially antennas.

The ARRL publishes many books with plans for radios and antennas. See the "ARRL Bookshelf" section in that copy of QST I mentioned. :-) For antennas, they have the Antenna Handbook, several Antenna Compendiums, and more theoretical books like _Reflections_. For radios, see _Solid-State Design for the Radio Amateur_, W1FB's _Notebooks_, and _QRP Classics_.

For good background info on all aspects of ham radio, buy the _ARRL Handbook_. It certainly won't replace the other books, but it will give you a solid foundation.

Your local ham dealer probably stocks many of these, or you can mail-order them from the ARRL or a dealer like Tucker Electronics or the Ham Radio Bookstore.

Lab Notes: Kits Galore!

Summertime, and the living is easy. It's the perfect time to build a kit! You can do it all at once in a mad frenzy, or work on it piecemeal. Either way, you're guaranteed fun, education and true pride of ownership. Mike Gruber, WA1SVF, ARRL Laboratory Engineer, briefly discusses kit-building and provides a valuable list of kit suppliers.--WB8IMY

Q: I'd sure like to try an electronics project, but I'm not quite sure where to begin. I'm considering kits, but is kit building really worth the trouble?

A: Well, when I was a youngster I would watch with fascination as my Dad assembled his latest Heathkit project in our basement. Smoke would often curl up from his soldering iron late into the night. Friends and family would gather for the grand unveiling of his latest triumph. A drawer full of those red plastic nut starters that came with each and every kit (remember those?) is still in our basement somewhere! I received quite an education when I was finally old enough to follow in Dad's kit-building footsteps. This early exposure to electronics inspired me to obtain an Amateur Radio license and even pursue a career in electronics.

Q: Are kits difficult to build? What ever happened to all those classic kit manufacturers, anyway? What about Heath? I've heard that they're out of the kit business. Does this mean that kit building is a thing of the past?

A: Whoa! Easy, big fella. Let me answer your questions one at a time. First, the level of difficulty varies with the individual kit. A very simple kit can require only minimal time, skill and experience to put together. Complex kits can, of course, be considerably more difficult. It is important to determine which kits match your abilities. When selecting a kit, be sure to consider any additional purchases that may be required, such as knobs and cabinets. You may also need test equipment to complete the project.

Second, it's true that many of the old kit manufacturers, such as Eico and Knight-Kit, are no longer in the kit business. Back in the days of point-to-point wiring and vacuum tubes, a kit manufacturer stood a decent chance of succeeding in the consumer electronics market. They offered better products at lower prices--including products not normally available. Today, the miniaturization of electronics, modern assembly techniques, and cheap overseas labor have taken away much of the competitive edge that kit makers enjoyed. Heath, however, is still making kits, mostly of the educational variety. These may be excellent starter kits to get your feet wet.

Finally, it's not true that kit building is a thing of the past. True pride of ownership and the thrill of doing it yourself are things that mass-produced products don't always offer. Many

companies still make kits to fill this niche. Just about any skill level can be accommodated if you know where to look.

Q: Okay, you've sold me. I want to run home right now, warm up my soldering iron! I'll bet you've even compiled a list of kit manufacturers for me. How about it?

A: Yep, here's the list. Happy kit-building!

A & A Engineering
2521 W LaPalma, Unit #K
Anaheim, CA 92801
tel: 714-952-2114
fax: 714-952-3280

A & A offers a wide range of amateur related kits from QRP transceivers to a digital frequency synthesizer and a 450-MHz spectrum analyzer. Electronic components, enclosures, ICs and ham-related publications are also available. Catalog available.

Antique Electronic Supply
6221 S Maple Ave
Tempe, AZ 85283
tel: 602-820-5411
fax: 602-820-4643

Numerous kits for reproducing antique and vacuum tube radios are available. Antique Electronic Supply is also an excellent source for parts, components and documentation for antique radios. Catalog available.

C & A Electronic
PO Box 25070
Athens, 10026 Greece
tel: 52.42.867
tel: 52.42.537

Established in Athens in 1977, C & A Electronic has now grown to 15 employees. Their current 53-page catalog includes over 150 kits with, according to Simeon Krizias, SV1AYI, of C & A, more on the way. The projects range from the relatively simple to the complex. Kits include Amateur Radio, high-fidelity stereo, power supplies and instrumentation projects. Ready-made versions are available for novice kit-builders who prefer advanced or intermediate kits. A special US price list is available.

CCI (Communications Concepts, Inc)
508 Millstone Drive
Beavercreek, OH 45434
tel: 513-426-8600
fax: 513-429-3811

CCI's catalog features many linear amplifiers and projects from Motorola Applications Notes. Amplifier boards and various components are offered separately as sets. Other kit projects include an ATV receive converter and an audio squelch control. Semiconductors and other components can also be purchased separately. VISA and MasterCard accepted.

Cirkit Distribution Ltd.
Park Lane
Broxbourne
Herts EN10 7NQ
tel: 44-992-444111
fax: 44-992-464457

More than 100 kits for the radio amateur, including preamps, power amps, converters, speech processors and a dip meter. Catalog available. Cirkit does not have a price list in US dollars, but does accept Master Card, VISA and American Express.

Curry Communications
852 North Lima St
Burbank, CA 91505
tel: 818-846-0617

Two kits currently available:

The 80-AU converts the entire LF/VLF band to the 80-meter amateur band. Cost is $59.95.

The SAM-1 is a transverter that enables operation on the license-free 1750 meter band with an 80-meter amateur transceiver. Cost is $89.95.

Down East Microwave
RR 1, Box 2310
Troy, ME 04987
tel: 207-948-3741
fax: 207-948-5157

Down East Microwave (DEM) is owned and operated by Bill Olson, W3HQT. Numerous kits are offered for VHF, UHF and microwave projects. Down East Microwave also carries an extensive line of antennas. Office hours are 9 am to 4:30 pm Eastern Time, Monday through Friday. Call anytime; Bill says to be sure to leave a message on the machine if no one is available. Business and personal checks as well as VISA and MasterCard are accepted. COD orders carry a $4 service charge. Catalog available.

FAR Circuits
18N640 Field Court
Dundee, IL 60118

FAR Circuits provides PC boards for a number of QST projects.

Hamtronics, Inc
65 Moul Rd
Hilton, NY 14468-9535
tel: 716-392-9430
fax: 716-392-9420

A wide variety of amateur related kits are available. Kits include VHF and UHF exciters, linear amplifiers, receivers, repeaters, repeater accessories, preamps and receive converters. Some kits are FCC type accepted for commercial service. A 40-page catalog is available.

Heath Company
PO Box 1288
Benton Harbor, MI 49023-1288
tel: 800-253-0570

Although Heath's kit line is no longer as extensive as many old-timers may recall, they still carry a number of "build your own" electronic projects. Their current kit line includes two weather computers and numerous educational kits, such as a portable radio, an electronic cricket and a power supply. VISA, MasterCard and American Express accepted.

John Langner, WB2OSZ
115 Stedman St
Chelmsford, MA 01824-1823

John provides the Pasokon SSTV project kit featured in January 1993 QST. One empty expansion slot in a 286 or faster computer, 640K of memory, a color monitor and a VGA display adapter are all you need to send and receive all popular modes of SSTV. The complete kit is $199.95, or $229.95 for an assembled and tested unit.

Kanga US
Bill Kelsey, N8ET
3521 Spring Lake Dr
Findlay, OH 45840
tel: 419-423-5643 (7 pm to 11 pm Eastern Time only)

Bill, N8ET, operates Kanga US as an importer of QRP kits manufactured by Kanga Products in England:

Kanga Products
Dick Pascoe, G0BPS
Seaview
Crete Road East
Folkstone CT18 7EG
England

Dick is currently the only person at Kanga in England. Kanga offers over 25 Amateur Radio kits with emphasis on QRP. Kanga's philosophy is to keep prices low by not supplying parts typically

found in most junkboxes, such as the cabinet and knobs. Send one unit of First Class postage when requesting a catalog from Kanga US. VISA and MasterCard accepted.

Lake Electronics
7 Middleton Close, Nuthall
Nottingham, NG16 1BX
England
tel: 0602 382509

Every Lake kit is complete, down to the last component, including knobs and screws. The catalog features QRP transceivers, a receiver, an SWR meter, a power meter/dummy load, an antenna tuning unit, an audio filter and a power supply. A special price list is included for overseas customers. VISA, MasterCard and Eurocard accepted.

Mark V Electronics, Inc
8019 E Slauson Ave
Montebello, CA 90640
tel: 213-888-8988 (Catalog and information)
800-423-FIVE orders only (outside California)
800-521-MARK orders only (California residents)
fax: 213-888-6868

More than 70 kits available including high-fidelity audio products, laboratory equipment, power supplies, light controllers, games and numerous miscellaneous projects. Audio amplifiers range from 6 to 300 watts. Kit difficulty levels are individually specified as beginner, intermediate or advanced. VISA, MasterCard and American Express accepted.

M.A.S. Enterprises
UHF Technik
104 King St South
St. Jacobs ON N0B 2N0
Canada
tel: 519-664-1273
fax: 519-664-3082

Four kits currently available: a 6-meter SSB transverter, 2-meter foxhunting receiver, 24 cm FM TV transmitter, and a baseband processor for the TV transmitter. These kits are not intended for beginners. A catalog is forthcoming. Prices range from $69 to $198. Owner: Manfred H. Zielinsky, VE3ZIE.

Microcraft Corporation
P. O. Box 513
Thiensville, WI 53092
Tel: 414-241-8144

Currently available kits: Morse-A-Word CW reader, RTTY Reader, Morse-A-Keyer (CW keyboard keyer), Videoscan 1000 SSTV decoder,

Code*Star reader for CW, RTTY and ASCII. Kit prices range from $140 to $595.

Oak Hills Research
20879 Madison St
Big Rapids, MI 49307
tel: 616-796-0920
800-842-3748
fax: 616-796-6633

Founded by Doug DeMaw, W1FB, and sold three years ago to Dick Witzke, KE8KL. Oak Hills Research has long been a source of QRP kits and components. Several new products are now being added to the company's line. Hours are weekdays from 8 am to 6 pm. VISA and MasterCard accepted.

Ocean State Electronics
PO Box 1458
6 Industrial Dr
Westerly, RI 02891
tel: 401-596-3080
800-866-6626 (orders only)
fax: 401-596-3590

Kits appear on pages 56-61, 64 and 85 of Ocean State's 1993 catalog. Included are a QRP transceiver, several receiver and robot kits, a keyer and code practice oscillator, educational and training kits and electronic test instruments. VISA, MasterCard and COD accepted; $10 minimum order. Open weekdays 8 am to 5 pm EST, Saturday 10 am to noon. Frank Pellicano, WB1GTK, President.

Ramsey Electronics Inc.
793 Canning Parkway
Victor, NY 14564
tel: 716-924-4560
fax: 716-924-4555

A variety of kits ranging from complete amateur transceivers to mini-kit type projects for under $10. Products include VHF/UHF FM transceivers, HF receivers, QRP transmitters, an active antenna, a CW keyer, 20 watt amplifier for a QRP transmitter, shortwave receiver, RDF kits and other projects. Ramsey charges a flat rate of $3.95 for shipping, insurance and handling. Call or write for a free catalog.

$equence Electronics
John Beech, G8SEQ
124 Belgrave Road
Coventry CV2 5BH
England

Monoband direct-conversion receiver and transmitter kits available from 80 through 6 meters. All parts, including a

diecast box and printed circuit board, are included. A three-band version is also available. Other kits include a receive and transmit converter from 10 to 6 meters and an FM transceiver for 50, 70 or 144 MHz. All $equence kits are specified as intermediate-level projects.

Ten-Tec, Inc., T-Kit division
1185 Dolly Parton Parkway
Seiverville, TN 37862-3710
Tel: 1-615-453-7172
Orders: 1-800-833-7373
Fax: 1-615-428-4483

Available kits include 9-Band Shortwave Receiver, 2 Meter Power Amp (for HTs), 6 Meter Transverter, SWR Bridge/Wattmeter, RF Ground Counterpoise, Dummy Load, Air-core Variable Capacitor, and many more items. A 2 Meter FM Transceiver is under development. Write for catalog. Minimum order $15.

Townsend Electronics
PO 415
Pierceton, IN 46562
tel: 800-944-3661 (US Only)
219-594-3661
fax: 219-594-5580

Townsend Electronics carries kits by one of the largest kit manufacturers in England:

C. M. Howes Communications
Eydon, Davantry,
Northants NN11 6PT,
England
tel: 0327 60178

Townsend's 26-page catalog features receivers, transmitters and transceivers. Also included are such projects as a speech processor, a VHF converter, a code-practice oscillator and a digital frequency display. All kits are engineered by Dave Howes, G4KQH, a former BBC engineer, who founded C. M. Howes in 1983. Townsend Electronics accepts VISA and Mastercard. Amateurs outside the United States may order kits from directly from C. M. Howes (Dave requests a couple of IRCs for overseas catalog requests.)

Tucson Amateur Packet Radio (TAPR)
8987-309 East Tanque Verde Rd, No. 337
Tucson, AZ 85749
(817) 383-0000 (voice mail)
(817) 566-2544 (FAX)

TAPR is a nonprofit research and development corporation with more than 1000 members wordwide. It was founded in an attempt to

develop a low-cost Terminal Node Controller (TNC) kit. This effort resulted in the now famous TNC-1. TAPR's second development, the basis for most TNC's currently in use, is known as the TAPR TNC- 2. TAPR no longer provides complete TNC kits. Instead, they have licensed several commercial manufacturers to produce the TNC-2 design. They still provide the TNC-2 circuit board and associated EPROMs, EPROM codes, schematics and manuals. Modems and related hardware are still available in kit form. TAPR also offers an extensive selection of associated software. Catalog is available.

Truscott's Electronic World
Division of Shredall Pty. Ltd
30 Lacey Street
Croydon, Victoria, 3136
Australia
tel: (03) 723 3344
fax: (03) 725 9443

Resells products and kits from Dick Smith, Altronics and Arista. Several other kits also available. Most kits are not for the beginner and were featured projects in Amateur Radio Magazine, the monthly publication of the Wireless Institute of Australia. A catalog is now in the works and new kits are being added.

624 Kits
171 Springlake Dr
Spartanburg, SC 29302
tel: 803-579-6262 (days)
803-583-1304 (after 6 pm)

624 Kits was founded several years ago by Pat Bunn, N4LTA. The name 624 was originally chosen because the company made kits for the 6-, 2- and 420-MHz bands. Even though they no longer make VHF/UHF kits, the name remains. Most of the products offered by 624 are QRP in nature and many appeared in QST. Included are numerous transmitters, receivers, W1FB projects, the Modified Cubic Incher, the Neophyte Receiver and the Gary Breed, K9AY, receiver kit. Any kit can be returned for a full refund before assembly. All parts are 100% guaranteed and repair service is also available. Please include two units of First Class postage when requesting a catalog.

Try DC Electronics in Scottsdale, Arizona. Mailing address is
PO Box 3203, Scottsdale, AZ 85271. Phone number: 800-467-7736

They do have a $15 minimum order, but I think that is waived on pre-paid orders. I don't have their catalog in front of me so I don't know for sure if they have that chip. I do remember seeing some Signetics chips.

>It will run a good KW (4KV plate voltage). I have a good vacuum relay for
>the output RF switching. I am planning on using a RF rated reed relay to
>switch the input RF.

Get a copy of the January issue of QST. There is an article in there
by linear expert, R. Measures, AG6K. He describes a QSK circuit using
a Kenwood RF reed relay for the input switching and a Jennings RJ1A for
the amp. I built a QSK circuit based on his description and am very
pleased with the results. The exciter relay is a replacement part
for Kenwood TS850S. It cost about $30 w/shpg, from Kenwood's East
Coast parts distributor.

I used a quad-trace scope to measure the timing of input and output
relays and was amazed how fast and clean the timing mechanism was.
I used Measure's values for all time critical functions.

These things have always puzzled me too.
As my current understanding goes, an oscillator tuned to the
approximate frequency of reception is periodically stopped and then
allowed to restart at a rate of, say, 40KHz. If some received
energy at the right frequency is coupled into the resonant
circuit, the restart tends to be quicker, with a noticable effect
on the current drawn by the oscillator.

The current drawn by the oscillator contains the output signal.

Is this how it works?

Best regards,
Jeroen Belleman

: It would be nice if the battery lasted at least a week.

: Idea #1
: Build a simple Distance measuring system (Pulse and respond)
: Alarm when the dog was 300ft +- 50ft from the house.
: +-50 Ft is +/- 50 nsec

<stuff deleted...>

: 4)How does the commercial perimeter system work?
: What frequency does it operate on?

Paul,

Why bother jumping up and running after the dog every time he escapes?
The commercial systems use an electrical shock collar to teach the dog
not to go beyond the perimeter. On most dogs it works great. On really
big dogs, I've heard that it doesn't faze them at all. Anyway, I think
they work on a field strength basis. An antenna wire is run around the
property perimeter, and when the collar comes within about a meter, zing!
Sounds cruel, but the dog doesn't mind so much (well if he could talk,
I guess he'd say he does :->). I'd imagine that it uses a pretty low
frequency, like 100 KHz, but I really don't know. My impression is that
they are expensive, like a couple hundred for a system. Any pet store
has info on the systems (try Petco, Premium Pet, etc.).

BTW, I guess we should move this to rec.pets.dogs.

The antenna/ground is important for improving reception, but unless you
live far from any AM station, I wouldn't worry about it, just yet.

: though I have connected my antenna to a store-bought radio and noticed a
: definite improvement in clairity) or that the capaciter is not of the
: right capacitance. The instructions I'm following call for a 365 picofarad
: capacitor, but in the schematic, they have a variable one. What I'm
: getting for a result is not static, but no sound whatsoever-- could this
: be related to improper grounding, antenna, or capacitance?

You need a variable capacitor to properly tune the radio. After all,
if you tune a normal radio to the wrong frequency you just get static.
The headphones you are using may not be sensitive enough to pick up static.

2384. Band trap filter designs wanted!

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-22 18:19:38 UTC
From: sorgatz@avatar.tti.com
Message-ID: <1994Aug22.181938.22986@ttinews.tti.com>
Source record: 116574

Im looking for a "band trap" filter design, it should begin attenuating at or near 26 MHz, have very steep skirts, be of a 9 or 11 pole design, so that the filtering is at least 90dB, and the upper cutoff should be at or near 28 MHz. If this sounds like an 11m trap, it is! Such that all frequencies BELOW 26 MHz pass, and all ABOVE 28 MHz pass. To me it seems like a low pass filter (26) and a high pass (28) in parallel, but Im unsure of how to match the two sections so as to provide a trap band filter with 50 ohm impedance and a .5dB insertion loss. Anybody?

(the qrm in my neighborhood is fierce!)

Source record: 116575

I have two questions which I thought I'd roll into one post:

1) I seem to remember someone saying on this group that FM tranceivers were relatively easy to make with the right chip set. Does anyone have a very simple design, that could be assembled cheaply?

2) I have come into an accesory VFO which has memories as well as other bells and whistles on it, and was thinking it might be nice to build an HF transciever around it. So I'd like a simple design that puts out at least a couple of watts, that would be capable of CW and SSB.

I've got pretty good soldering skills, and used to be both a compter repair tech, and various types of telco tech. I'm perfectly comfortable with building, but my theory is weak so, I'd like a design that is simple to align and repair. I know somebody is thinking that I should buy a kit. I'm thinking about doing that too, but building my own might be more fun.

End of line...

I would be very hesitant to put any electronic equipment in a dishwasher. Don't forget that it is assembled with lead solder. I imagine that you will end up with measurable amounts of lead on your next load of dishes.

2387. 440Mhz 50 ohm - 70 ohm transformer

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-22 21:20:07 UTC
From: JAY@medicine.dmed.iupui.edu
Message-ID: <JAY.49.2E591687@medicine.dmed.iupui.edu>
Source record: 116579

I have been looking for information on building a 50 ohm - 70 ohm transformer for 440Mhz.

I have been told that to pick up ATV at 439Mhz, you can use a cable ready TV if you match the antenna to your TV. I have the TV, and I have the antenna, but I need to match the two.

If anyone has any ideas, let me know.

Thanks
Jay

2388. Portable EME Station -- Questions

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-22 21:39:04 UTC
From: btoback@netcom.com
Message-ID: <btobackCuyHH5.Hw4@netcom.com>
Source record: 116578
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.homebrew

I hope that one of these will be the correct newsgroup for this question; advice on redirection is welcome.

I'm thinking of assembling a portable EME station that I could use for demonstrations at schools. I don't know if such a thing is possible at any reasonable cost, or for any reasonable definition of "portable." But here are the questions anyway:

1. I assume that because of my Arizona location, I can't use 432MHz. This seemed to be the best compromise between power amplifier practicality and antenna size. Is 23cm a good second choice?

2. Assuming that 23cm is a good second choice, how can I generate the necessary power on that band? I've found one amplifier design, in the 1975 (!) ARRL Handbook. It uses a pair of 3CX100A5 tubes and could be used for 200W continuous or 400W intermittent. Since the antenna will be compromised for portability's sake (no 24-ft dishes), I'd like to get more power than this. Has the state of the art improved since 1975? If so, where can I find construction information?

3. Various publications have stated that Yagi designs have proven unsatisfactory for EME work at 23cm, but don't say why. I can make guesses (losses in the splitter network, etc.), but don't know for sure. Is it in fact possible to use these for 23cm EME work? A back-of-the-envelope calculation suggests that a 24dBi array could be quite practical, but I haven't considered splitter network losses.

4. If a Yagi array really can't be made practical, does anyone know of some portable dish designs -- 4m or so? The dish doesn't have to be rugged or able to stand up to weather since it will never see a permanent installation.

The objective is a station that can hear its own echoes -- not necessarily with communication-capable quality -- and can communicate with a "big gun" EME station. If my planning is going in a completely fruitless direction for such an objective, I'd like to know early on!

Thanks,
-- Bruce Toback

I meant to reply earlier. I am gathering parts for a 4-1000 myself, and only need the power transformer and vacuum variables for the plate tuning and loading. I have a good bit of experience, however, with helping a friend with his 4-1000's. If you lay it out cleanly, have a good input circuit (it takes more than
100 watts to get the 4-1000 to really start moving), and a hefty power supply you will
be the proud owner of a fine signal!!! (btw: I had all the parts years ago to build
one but sold them....out of stupidity or poverty, can't remember which!)

I owened the Clegg Thor-6 (35 watts AM) and the Zewus (150 watt
am) 6-2 tx used with the Intercepter RX. Ed Elegg sold his ham
gear company to one of the big corporations who promptly swalled
their patents and shut down the ham production!

A suggestion for the 6 meter amp would be to look for old low-band
fm tx strips which were made by motorola, ge, rca, etc. The tubes
would typicaly be 6146, 829, 5894 etc and outputs ranged from
30-200 watts. That would acquire a functional socket, maybe a good
tube and tank circuits which could be modified easily to cover the
six meter band or the 10 meter band. If you acquire old low band
fm base stations that would also get you a class c power supply.

Bias supplies for SSB useage would not be as big a problem as the main plate and filement supplies. You can also try the same approach with solid state rigs but I have had no experience in such conversions. If you are interested in mobile use of the amp you might look for somehting like a motorola g strtip transceiver and abondon the rx and exciter portions.

good luck..

I bet you a dozen doughnuts you end up with measureable amounts of
lead on every load of dishes you do. Lead is detectable down into the
ppt range.

The neutral-to-slightly-alkaline water produced by most dish
detergents shouldn't leach much lead at all from solder, not even the
cruddy 40/60 SnPb stuff. That which does come out will be thoroughly
washed away.

In short, don't lose any sleep. If you are paranoid, one empty-unit
cycle should wash it all away.

: (the qrm in my neighborhood is fierce!)

You really need _that_ much attenuation?? 60dB would reduce 1 watt down to 1 microwatt, and 1 watt is a whale of a lot of power to be receiving...

The conventional way to design a band-reject filter is to start with a lowpass filter and transform it. Basically, you would build a 1MHz lowpass, and resonate all the (series) inductors with parallel capacitors and all the (shunt) capacitors with series inductors; each would resonate at 27MHz. If you are starting with an elliptical response, you don't just have series inductors and shunt capacitors...

If you want 0.5dB insertion loss, you will have to have inductors with rather high Q: if you are dealing with a 9 pole design, the loaded Q of the high-Q resonators will be above 100, and 0.5dB loss indicates you need an unloaded Q around 20 times that, off the top of my head. (Please don't turn the flames too high; this was a very quick mental calculation.)

There is a system known as "Biotrack" available in the UK for animal tracking - also used for finding free flight competeition model aircraft. It works on 173 MHz and is legal here - seems to work out to about 1 mile on the ground. There are various transmitters available - the smallest is only a few grams and truly tiny. No problem to fit on a collar. Battery life is about a week for the smallest. The snag is the cost of the matching DF receiver - a very small hand held with a 3 el yagi - about 350 ukp ($500 or thereabouts, I guess). You could always make your own, of course. The transmitters are about 48ukp ($60-70).
I believe the supplier is :

There are at least a couple of more recent derivatives of this, although one depends on a particular version of Creative's drivers. I have an incomplete one written in Gnu C for the DJGPP port.

The published versions are dspmorse, by Rocco Caputo, and sbpmorse by Darrek Kay (kayd@xanth.cs.orst.edu).

Unfortunately this is nothing like what was being asked for, which is analogue input and output with digital filtering, which you can't do on any of the 8 bit SBs in real time.

Do not forget that capacitors have drift too. Fortunatly you can use
appropriate capacitors to compensate L's drift. Mechanical stability is
mandatory. Use stable capacitors, some ceramic type C's are a good choice.

2400. AM Antenna question

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-24 06:26:57 UTC
From: seanh@nucleus.com
Message-ID: <Cv10Ky.312@nucleus.com>
Source record: 116586

Hello, I thought this would be the best newgroup to post this question since the questions is mostly radio-oriented with less emphasis on electronics...

I'm currently working on a (tube-driven) AM radio. I've gotten this thing to work quite well using a a long (50') antenna, it sounds great! The unit employs the use of a homemade tuning coil which consists of 2 inches of 26 ga. wire wound around a 2 inch OD plastic pipe. This coil is also tapped a third of the way down. The two ends of the coil are connected to the antenna and to ground, respectively. The tap leads to the detector and accompanying circuitry.

Now thats you have a bit of background... here's my question: I'd like to build this unit so that it can operate without having to use 50' of wire as an antenna. I'd like eventually have the unit so it does not require an external antenna like commerical AM receivers. I guess my question is, how do commericial AM receivers accomplish this without the use of an external antenna? I know that somehow this is done by using a (seperate?) coil wound on the main tuning coil as an antenna, but the speciics of this are unknown to me. I really dont know if commerical receivers employ RF amps or active antennas or whatever because the designs are so varied. My radio is not superhet or regenerative or anything -- just TRF.

So how could I 'inductively' extend my antenna?

Thanks in advance!

- SVH

Amazing coincidence, Tom. I'm in the process of building this same VFO
(out of the first edition of QRP NOTEBOOK). I'm using the variable cap
from a TV UHF tuner. I've wound all the inductors/chokes on cardboard
forms, air core, except for the 500 uH choke - I'll lose count of the
turns if I have to wind an inductor that large.

Almost all the parts for it were found in an old TV; I'll have to
break down and *buy* the MPF102's at RS, though.

Did you actually use the 1N914 diode? I've got dozens of diodes so
I'll pick one at random.

Keep us posted as to the status of the VFO, and its drift...

Bruce Toback KN6MN (btoback@netcom.com) wrote:

: 1. I assume that because of my Arizona location, I can't use
: 432MHz. This seemed to be the best compromise between power
: amplifier practicality and antenna size. Is 23cm a good
: second choice?

It probably is since you want to hear your own echos. 2 meters
might be better if you just wanted to contact a few really
big stations. Of course, due to the scheduled nature of this
operation, it may be entirely feasible to coordinate your activities
with the primary users of the spectrum. 70 cm is a much better
choice, due to equipment availability and the number of stations
available to contact.

:
: 2. Assuming that 23cm is a good second choice, how can I generate
: the necessary power on that band? I've found one amplifier
: design, in the 1975 (!) ARRL Handbook. It uses a pair of
: 3CX100A5 tubes and could be used for 200W continuous or
: 400W intermittent. Since the antenna will be compromised for
: portability's sake (no 24-ft dishes), I'd like to get more
: power than this. Has the state of the art improved since 1975?
: If so, where can I find construction information?

You can combine these amplifiers with hybrid combiners. There
reportedly are higher power tubes available, but I would call
designs using these experimental. Not what you would want for
a demonstration. Be sure to shield the cavity. An extra layer
of shielding might even be appropriate for this application.

: 3. Various publications have stated that Yagi designs have proven
: unsatisfactory for EME work at 23cm, but don't say why. I can
: make guesses (losses in the splitter network, etc.), but don't
: know for sure. Is it in fact possible to use these for 23cm
: EME work? A back-of-the-envelope calculation suggests that a
: 24dBi array could be quite practical, but I haven't considered
: splitter network losses.

If you really had to, you might be able to make it work by installing
a preamplifier at the feed of each yagi. Since most amateurs have
difficulty coming up with *one* really good EME preamp, this technique
isn't practical. Even if you do this, most yagi arrays aren't anywhere
near as clean as a dish in terms as pattern. Actually, for receive, you
are really interested in something known as the gain to temperature ratio.
The temperature is the background noise when the dish is pointed at cold

sky. If you can cut it in half, say by going to a cleaner array, you can hear 3 dB better.

: 4. If a Yagi array really can't be made practical, does anyone
: know of some portable dish designs -- 4m or so? The dish
: doesn't have to be rugged or able to stand up to weather since
: it will never see a permanent installation.

Look at the K2RIW stressed parabolic dish design in Chapter 19 of the ARRL antenna book.

:
: The objective is a station that can hear its own echoes -- not
: necessarily with communication-capable quality -- and can
: communicate with a "big gun" EME station. If my planning is going
: in a completely fruitless direction for such an objective, I'd
: like to know early on!

2404. 2 M to FM Broadcast Reply

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-24 14:37:09 UTC
From: mack@mails.imed.COM
Message-ID: <9407247777.AA777747053@mails.imed.com>
Source record: 116593

Jeff:

This sounds like a good idea on the surface, but it has some very serious technical problems. FM broadcast is wideband FM (VERY wideband) whereas amateur is narrow band. The bandwidth of an amateur signal is about 15KHz (give or take a little) with channels either every 15KHz or 20KHz depending on where in the US you are. If things have changed in the last 5 years they may all be 20KHz now. Broadcast bandwidth is 200KHz. So you see if you use the broadcast radio you will actually be listening to 10 amateur frequencies at once.

If you could put a very narrowband filter (not practical at this frequency) between the converter and the radio, it WOULD be possible to receive an amateur signal. The problem would be VERY low audio output with a lot of background noise. It probably would work though!

Sorry to be the bearer of bad news.

2405. 440 MHz 50 ohm to 75 Ohm transformer Reply

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-24 15:08:57 UTC
From: mack@mails.imed.COM
Message-ID: <9407247777.AA777748853@mails.imed.com>
Source record: 116592

There are 5 ways to tackle this problem.

1) If this is receive only don't worry about it. The input Z of the TV is probably not all that close to 75 Ohms anyway.

Please note that the TV standard is 75 NOT 70 ohms!

2) If you REALLY want a good match, you can use a 1/4 wave transformer (see page 16-4 of 1988 or similar vintage ARRL Handbook). This requires 61 Ohm coax which is not readily available. However, 1/4 wavelength at 440 is 6.7 inches for air core coax. You can make a fairly good transformer from coax you make yourself from 1/8 od tubing for the center conductor and 3/8 od tubing for the outer conductor. Buy this tubing at most hardware stores or any model airplane hobby store. just find a way to keep the pieces concentric and solder on the proper connectors. This should be good for about 100 watts of power.

3) If you want a good match and you don't care about attenuation, just put a 24 ohm carbon composition resistor in series with the input. This is what we do when measuring 75 ohm systems on 50 ohm test equipment.

4) Use a PI filter to transform the impedances. See the section of the handbook on matching transmitters in the handbook.

5) Change your transmitter and antennas to be 75 ohm systems as suggested by someone else. There IS NOTHING sacred about 50 ohms. It just sorta worked out that that is what everyone but TV people use.

I personally like methods 1 and 2 above.

<<a step-down AF Xformer if you are using the wrong type.

<<Leon

I concur with Leon that you probably need to use a step down transformer for use with "normal" earphones. The following is a list of Radio Shack components to check against what you are using for a workable crystal set:

Transformer: 273-1380 1k to 8 ohms (1k side goes to diode)
Diode: 276-1123 1N34A This is germanium NOT silicon!
Capacitor 272-1336 this is a trimmer but it should work
coil 273-102 this is an interference choke but I have used it for this purpose.

You could also use the piezo speaker from Radio Shack P/N 273-091 instead of an earphone and transformer. It won't be high fidelity but you won't get that from a crystal set anyway!

If you have any more questions feel free to e-mail me.

2407. Re: 2M to FM bcast band converter

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-24 16:50:46 UTC
From: ka7oei@uugate.wa7slg.ampr.ORG
Message-ID: <15048@uugate.wa7slg.ampr.org>
Source record: 116595

You are right: The selectivity of this thing would be pretty rotten, but
it would be 'kinda a fun project to just do it to learn... Actually,
it would be pretty easy to throw together...

For the 48 MHz LO, I'd get one of those "canned" oscillators. Frequencies
around (and including) 48 MHz are pretty easily found. They have relativly
high output, and are easy to use. Best of all (in this application) their
relativly sloppy tolerances are of little consequence.

I would go with the following lineup:

Ant >--- 2 meter BPF --- 2 meter preamp --> JFET mixer <--- 48 MHz osc.
l
l
Output to B'cast rx

About a lineup like the above: First of all, you are very likely
to have a number of FM BC stations in the IF frequency range, so you'll
need to worry about keeping them out on two fronts: NOT getting
into the mixer in the first place, and NOT "leaking" into your
FM-BC receiver.

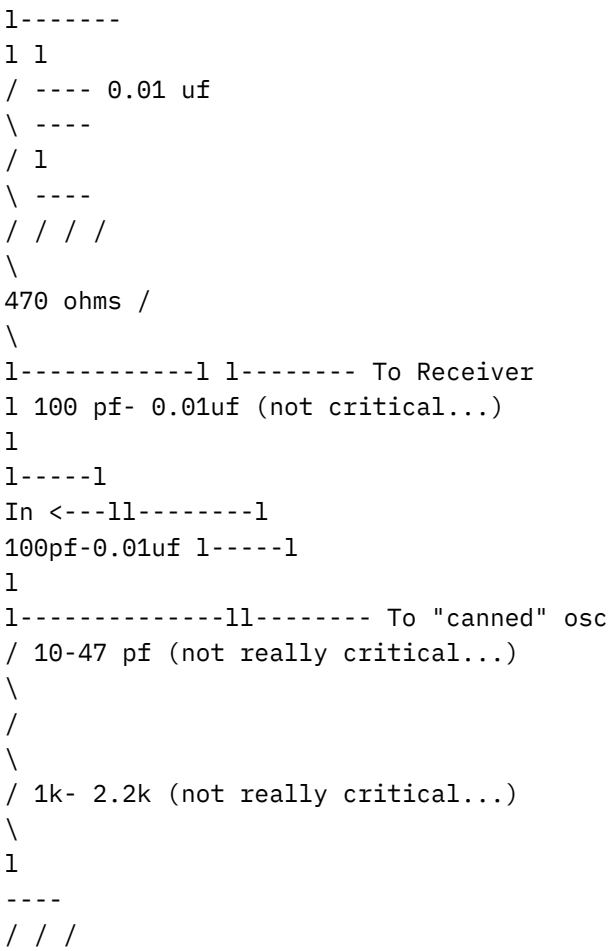
A lot of the newer BC receivers have provisions for a coaxial input (75
ohms) and are actually fairly-well shielded (i.e. no antenna, nothing
received at all...) Most receivers, though, are abysmal in that respect.

In the latter case, you may want to 'tweak' the receiver to tune from,
say, 108-112 MHz. The radiation from this gizmo is unlikely to cause
any planes to fall from the sky:-) You should be able to find a 36 MHz
'canned' oscillator, BTW, to accomodate this change.

On the former concern, that explains the 2 meter BPF. It really ought to
be pretty tight. I've built my own Xverters for 6, 2, 440, and 1.2 and
on the 2 meter xverter, its image would (and does) land in the FM BCB,
but I have no problems since I use a good BPF (and it *is* well
shielded...) If you look in a recent ARRL Radio Amateur's Handbook
(you *do* have one of those, don't you, and why not??? I get a new
one about once every 5-6 years... Enough has changed by then:-)
you'll see at least one 2 meter transverter article in the 'VHF Radio
Equipment' section. Plagiarize that... (and I'll get a spelling dictionary,
too...) and build a filter...

The mixer is/can be pretty easy. For something as low performance as this,
a simple JFET mixer would work well. Do this:

+6 to +12 volts
/\



(Oops, add a 100k-1 meg resistor from the gate to ground...)
The Source lead is the one on the bottom, BTW... and the tansistor
(oops) TRANSISTOR is something like the MPF102

This mixer actually has a fairly decent dynamic range and, being an
active device, is not particularly sensitive to its source and load
terminations with respect to IMD. A mismatch is more likely to cause
attenuation, actually... In fact, the "bipolar" version of this mixer
is used in most HT's... (Now you know why they generate intermod
so badly... Wait... They do a *good* job of generating IMD, don't they...:-)
The FET mixer generally has much better IMD specs than its bipolar equivalent.
(Reduce your undesired signal by 1 db, and you lose 3db of the IMD...)

I'd just try putting the output of the mixer into the input of the receiver,
myself. I *may* actually try a 300->75 ohm balun, too (you have to figure
out which side of the 300 ohm input is connected to the 75 ohm shield... if
it *is* connected like that...) and that would match it better, but this
isn't a high-performance unit anyway, is it?

Another thing: Going through the math, you may notice where a harmonic
of your LO lands... (48*2 = 96...) This signal will be *STRONG* and may
clobber a lot of the received band...

One thing about mixers: They can make good frequency multipliers...

One final thing about the mixers: If you use a diode-ring mixer (for my money, that's the best choice if you can afford the LO... power-wise and otherwise) you ***MUST*** pay attention to the terminations on all of its ports to preserve IMD specs.

On the output of the mixer, I wouldn't bother with any filtering since your radio likely has some it it already...

It sounds to me as though you already know how well this is likely to work, but it should work as well as you expected:-)

[lots of good info from Stephen trimmed to save b/w]

For antennas, I must also recommend Bill Orr's books: The Beam Antenna Handbook, which has a lot of good design and construction information on Yagis, LPDA's and quads. I also believe that he has published a more generic Antenna Handbook, which is probably worth checking out too.

I'm looking for information on taking a cheap Radio Shack AM radio (The colored ones they sell as "Flavoradio's") and adding a selector switch and a set of coils to change the frequency range to allow SW reception.

There was an article on doing this in one of the electronics mags (Radio Electronics, Popular Electronics, ...) two or three years ago but I just saw it in passing and can't remember which magazine or when it was printed (My best recollection is that it was Nov-Dec-Jan of '91).

If anyone remembers this or has some general comments on this type of conversion, let me know.

Hi Ray: I did mention this in my article when I said:

``...the selectivity will be awful (what's the bandwidth of an FM
station?)....''

but in an area with few active repeaters (such as here in Hawaii) it
might not be too bad. Hadn't thought about the low audio, though; I'll
just turn the volume up ;)

Remember, this project is just for fun - don't take it or me too
seriously.

>The current drawn by the oscillator contains the output signal.

>Is this how it works?

>Best regards,
>Jeroen Belleman

Not to my recollection... I missed earlier portions of this
thread, but as I understood it, the regenerative circuit was
an attempt to boost gain of a receiver stage by adding positive
feedback, up to *almost* the point of oscillation. If this
point was exceeded, the receiver would become a transmitter,
and all received signal would be swamped by the oscillator's
current. The super-regen was a design that eliminated the
critical hand-tuning of the regen (which had been by tuning
the feedback control for each received signal) by allowing
the stage to go into oscillation, which (mumble, mumble)
increased grid current, which built up a DC voltage by
charging a cap across a multi-meg grid-leak resistor, which
reduced the gain, driving it out of oscillation... The effect
was similar to a sawtooth relaxation oscillator controlling
the gain (via grid bias) of the amplifier stage. The operating
points were chosen so that the stage 'hovered' about the critical
gain level, getting a voltage gain of thousands(?) from a single
amplifier stage.

Or, something to that effect... :{)

8-24-1994

Hi all,
I need help calulating the capacitor values in this capacitor impedance matching network. See enclosed figure.

1. Given:
LC tank, L = 4.7 uh, Q =40, F operating = 10.7mhz, TOKO PN TK3149
Tank fed from NE-602 Mixer output pin 4, source Z = 1.5 K.
FL1 10.7 mhz Ceramic Filter, TOKO type CFSK TK2306

2. I calculated Ctotal to resonate tank at 10.7 mhz, = 47 pf's

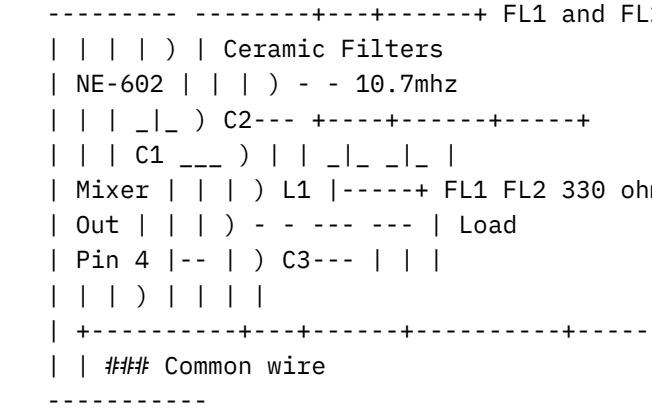
3. The capacitive divider tank must match 1.5K mixer output to the Ceramic filter FL1 which requires 330 ohm input termination.

4. I need help with design info method for converting 47pf into 2 or 3 capacitors for the capacitive divider.

5. Need a general solution to handle any practical impedance match.

6. Could use a reference. I have looked unsuccessfully.

==========
f0=10.7mhz



Zo source of Pin 4
from NE-602 mixer
is 1.5 K

==========
Thanks for any help,

>Is this how it works?

That is pretty accurate. Usually the circuit can be made to be self quenching by utilizing the base emitter junction to charge up a suitable time constant RC network so that the transistor is biased off and oscillation stops.

They are commonly used for garage door opener receivers, burglar alarms X-10 RF remote control in the 300 MHz range, they can be very simple and low power but fairly sensitive (1 microvolt).

My first radio control receiver I built 30 years ago used this technology which was originally developed in the 30's.

They are very broadly tuned, and have a very high noise output on no-signal. They are also very tricky to design and get going. I find it helps if the transistor is fairly close to its maximum frequency, otherwise it oscillates too readily and is not very sensitive.

handicnt.zip Optoelectronic 3000A & M1 handicounter reviews

handicnt.zip contains two text documents, reviewing Optoelectronic's 3000A and M1 handicounters, capable of time domain measurements on directly coupled and RF signals up to the gigahertz range. These have attained leading market position and are advertised in most Amateur Radio/electronic magazines. I have owned both of these meters and after running them them through the ringer, summarized my findings in these technically accurate reports, unbiased by advertisement dollars. Other users and possible owners will be interested in what they can - and can't - do.

I have uploaded to the SimTel Software Repository (available by anonymous
ftp from the primary mirror site OAK.Oakland.Edu and its mirrors):

SimTel/msdos/packet/
mlhacker.zip Zenith Minisport docs, hints, hacks & goodies

mlhacker.zip is a compendium of newsletters about the Zenith Minisport
laptop computer and its use as a packet radio host computer. Zenith
offers only minimal and expensive support for this popular but
discontinued 8086 compatible notebook computer. Newsletters contain
technical notes, construction projects, operating hints, resources,
architecture details and other related goodies. The Minisport Laptop
Hacker series is the result of owning and repairing Minisports and
donations from others on Internet and the Amateur Radio packet networks.

Special requirements: None

Changes: Compendium includes Minisport Laptop Hacker #1 - #22.

David_Shalita.ES_AE@xerox.COM wrote:
:
: To: qrp-digest@think:com Ham-Homebrew@UCSD.Edu
: 8-24-1994
:
: I need help calulating the capacitor values in this capacitor impedance
: matching network. See enclosed figure.
:
: 1. Given:
: LC tank, L = 4.7 uh, Q =40, F operating = 10.7mhz, TOKO PN TK3149
: Tank fed from NE-602 Mixer output pin 4, source Z = 1.5 K.
: FL1 10.7 mhz Ceramic Filter, TOKO type CFSK TK2306

Since you are using a relatively low Q inductor, it will be advisable to
lump the equivilent parralel resistance of the coil with the source
resistance ov the NE602. The Rp of the inductor is approximately 12.6K.
The 12.6K should be added in parrallel with the 1.5K for a virtual source
impedance of 1340 ohms. You really want to match 1320 ohms to 330.
:
: 2. I calculated Ctotal to resonate tank at 10.7 mhz, = 47 pf's

Correct.
:
: 3. The capacitive divider tank must match 1.5K mixer output to the
: Ceramic filter FL1 which requires 330 ohm input termination.

...or 1340 to 330 as per the adjustment I mentioned earlier :)

:
: 4. I need help with design info method for converting 47pf
: into 2 or 3 capacitors for the capacitive divider.

There are two simultaneous equations that you need to solve:

(C2*C3)/(C2+C3) = 47*10^-12 so that you get 47 pF

(C2/(C2+C3))^2 = Rout/Rin = 330/1340

In this case, the caps are almost equal since the impedance ratio is
very close to 4:1. Use C2=C3=100pF
:
: 5. Need a general solution to handle any practical impedance match.
:

For circuit Q's greater than 10, the procedure I outlined is general.

: 6. Could use a reference. I have looked unsuccessfully.

Another approach is to look at switched capacitor filters, such as the
National MF10. You can get very good results with a little work. The
Kantronics KAM uses MF10's in its HF section for filtering. With switched
cap filters you don't have to worry about matching oddball component
values- the frequency is determined by the clock frequency to the filters.
Instead, you have to worry about digital noise, board layout, and very well
bypassed power supplies.

Yes, the poster who was speculating about their mode of operation was talking about SUPER.

Another poster has mentioned that superregenerative detectors are still used in some garage door opener receivers. Apparently they don't radiate enough energy to exceed FCC or CISPR limits.

Hi Claude,

Yes, good point! I have a SWAN 500C which is my proof of this - I can only mention the fact that I haven't run it in about 10 years as the reason for forgetting this basic fact! :)

DeMaw & Hayward mention this fact, too, in "Solid State Design for the Radio Amateur". They say that one reason is especially found in high power oscillators: too much RF current drawn through a tuning capacitor causes internal heating, and this leads to the unintentional QSY. They feature a series-tuned Clapp which uses parallel capacitors in the series tuning element for this reason. I've actually built a variant of this VFO for a 40 m home-brew TCVR. It works well over 7.00 - 7.35 MHz range at least, and has a slight warm up drift. Once going, it will stay stable for hours! I use two buffer stages before feeding the signal to the tx & rx stages - this keeps the power drawn from the VFO circuit itself relatively low, and hence helps with rf currents in the tuning elements.

By chance, I had access to some old QST's a while back and happened to
come upon issues dating to the "dawn" of the superregen, so maybe I can
add a little background. The concept, invented by Armstrong, was
introduced to the world in 1922, and it was immediately heralded as the
receiver of the future, rendering current technology (regeneration)
obsolete. Most of the original circuits actually used a separate
oscillator to provide the switching signal to the received-frequency

oscillator (terminology my own!). Within a few months, the euphoria was wearing off, and QST was publishing articles asking "how come our superregens aren't any better?" Within a year they seem to have faded from amateur view, although they did resurface with the move into 10, 5 and 2.5 meters in the late '20s / early '30s.

For anyone interested in a great story on the early days of radio, let me recommend "Empire of the Air" by Tom Lewis (I think, not in front of me), published about two years ago.

2432. Dipoles & 50 ohm coax

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-25 22:54:38 UTC
From: greg@core.rose.hp.com
Message-ID: <Cv44z2.3CM@icon.rose.hp.com>
Source record: 116471

All this talk about matching 75 ohms to a typical ham tranceiver reminds me of a question I had... BTW, most I have asked this suggest I just try it and see what happens :-)

A resonant dipole antenna (yes, in the mythical Free Space) has an impedance of 70-odd ohms. If you hook it directly to a 50 ohm coax you will see a 1.5:1 SWR. You can trim the antenna to make it look like 50 ohms, but now it's not resonant any more, and isn't 50 ohms *resistive*; there's a reactance component to it. Also, a non-resonant antenna isn't as "good" as a resonant one.

So, what are the alternatives? One idea is to use 70-odd ohm coax (TV Stuff) at the antenna end. Perfect match. The problem is how to hook that coax to your 50 ohm tranceiver. If you just hook it up, you'll have that 1.5 : 1 SWR again. One school of thought is that at least this way the non-perfect SWR isn't over a long cable run, so your losses will be less, and maybe that is a better arrangement than the 50 ohm coax and a mis-match at the antenna, or shortening the antenna to fake out the feed point impedance.

50 to 75 ohm transformers don't appear to be readily accessable, and you will loose something in the translation. Don't know if that's better than the SWR mismatch (at one of the ends), or the shortened antenna.

So, all you Dipole Experts, what is the right answer? Yes, this is somewhat accedemic, since you never really have a mythical Free Space antenna, but at least you will be starting from a technically sound design.

Your thoughts?

>Greg KD6KGW

It isn't just that you're not in free space. The 73 + j40 ohms or whatever
it is is the impedance for a *infinitesimally thin* dipole. Real dipoles
are well down into the 60 ohm's or even the 50's.

Another error is end effect, which also helps to lower the input impedance
(like end loading would).

So the actual VSWR is only 1.2 or 1.3 to 1. Hardly worth worrying about.

If it's really important to you to get a 50 ohm input impedance, cut
your dipole about 10 to 15% short of a half wave and put in loading coils
to resonate it. Then you can hit 50 ohms exactly.

: 96 to 100 Mc so that the entire 2M band will be spread over the entire
: tuning range of the receiver (by changing the fixed capacitance in
: parallel with the tuning cap).

Why not just modify the FM receiver. I got a Scott 515 tuner up to 155-160 MHz. Had to wind a new LO coil but the front end didn't need replacment. Found out just how boring some of the local 2 meter repeaters could be. ;-) The actual reason was to see if I could get it up to the 137 MHz weather satellite frequencies, but this tuner was so much better than any other FM receiver I have, I tuned it back. GASFET front end, and all that. Bought it at a used stereo store for $30. If you really wanted to, you could replace the 10.7 ceramic filters with something narrower, although you might have to do some digging to find them. Like get them out of a broken scanner, or as replacment parts for same.

Or back to original method, use an TV tuner. With an older (say turret type) tuner, the LO would be right somewhere around channel 10. Retune the input from 200 something MHz, and redo (or remove) the output filtering from 40-45 MHz to your FM band segment. (You must have some of them left over from your CW transmitter parts supplies.)

This sounds familiar. I've used a streetlight post as an antenna support - tossed a weighted fishing line over the light's arm (overhand!) and tied that to my antenna wire (used small diameter speaker wire - almost invisible). Also, the fire hydrant plug made a great ground connection, using the city's watermains as my counterpoise.

I must thank the city some day for supporting my antenna system.

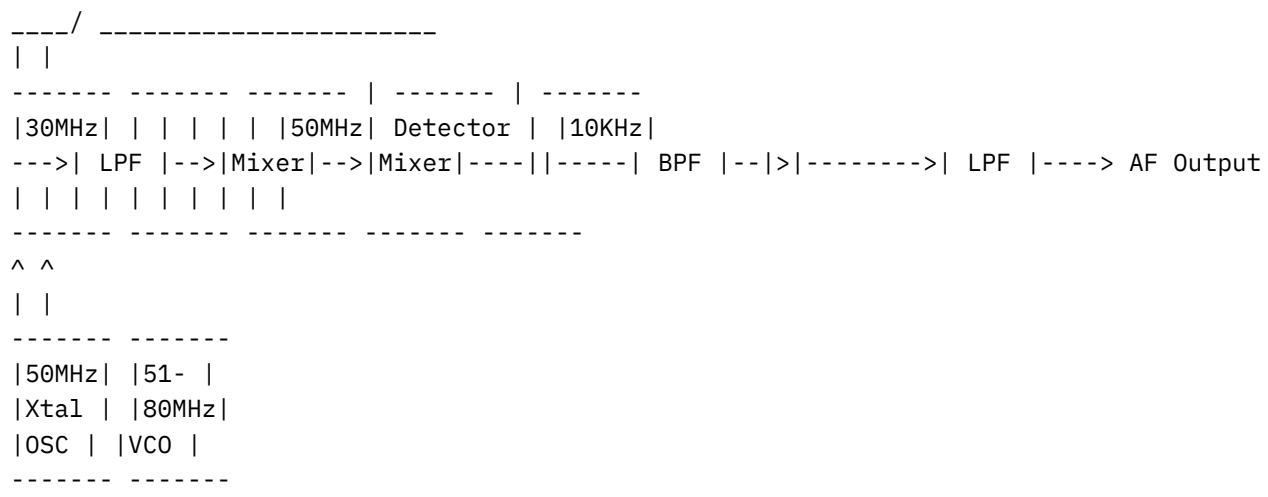
2437. AM/SSB Receiver Project

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-26 07:47:26 UTC
From: ian.mitchell@research.utas.edu.au
Message-ID: <33k6me$mmo@franklin.cc.utas.edu.au>
Source record: 116476

Hello All,

I am planning to build a simple SW receiver based on my own design with AM and SSB modes and have come up with the following:



The idea is that the SW band is shifted up by 50MHz so that the whole band can be tuned by a VCO with a single tuned circuit, no band switching necessary.

With the AM/SSB switch open a 50MHz band pass filter preceeding a diode detector enables the reception of AM signals. With the switch closed the signal after the first mixer is direct tuned for SSB/CW reception.

I hope someone can answer some of my questions:

1. Is there anything fundamentally wrong with this idea?
2. Would a parallel LC circuit be sufficient for the 50 MHz BPF?
3. Will a diode detector work OK at 50Mhz?
4. What sort of front end would be OK?

I am a beginner to RF stuff so any help would be most gratefully accepted,

Ian.

: Your thoughts?

: Greg KD6KGW

75 to 50 ohm transformers are easily made. The ARRL handbook has had
construction information. The loss is very low.

Use open wires and a matching unit. Make the dipole long enough for 80 meters
and you have a all band antenna.

Use only a single support and make an inverted vee. These tend toward a
50 ohm impedance.

Use 50 ohm cable and don't worry about the SWR, unless you have a rice
box that shuts down at 1.5, then use a matching unit.

Really, a 1.5:1 SWR is not anything to lose sleep over.

Source record: 116480

Hello Ian,

Sorry to say so, but the receiver design is not going to work like this.
Having a high first IF is a good idea and common in modern communication
recievers. But implementation is not easy.

the stages will have to be:

1) input mixer wit VFO from 1-30 MHz to 80 MHz
2) !Quarz! filter, 20 or so kHz wide
3) 1st IF amp
4) mixer to 2nd IF (9MHz)
5) Quarz filters, 4kHz for am and 2,7 kHz for ssb.
6) detectors as usual.

Alone the VFO for 50 tu 80 MHz will be all but simple to get to work.

a simple receiver for HF is some thing like a direct conversion receiver.
but even than the VFO will be a problem.

Good luck, Moritz DL5UH

2442. 2M to FM broadcast converter???

Please don't misunderstand my question...

Why would you want such a thing??

Even if you built one you can't receive FM broadcast signals
on a 2M FM receiver. The deviation is 75kHz wide! If would
overload your dedicator. You can't go the other way (receive
2M on an FM broadcast receiver). It is designed for the 75kHz
wide signals. You would have to crank the volume up all the
way to hear the audio. You DEFINITELY CAN'T TRANSMIT
ON BROADCAST BAND FM FROM YOUR 2M RIG THROUGH A TRANSVERTER!
For one, your rig is not FCC type accepted for that.
Secondly, you are limited to 1 miliwatt (1000 microvolts)
and 3' of antenna if you want to transmit on the FM broadcast
band.

```
I saw a circuit for this, using a regular AM radio to recieve SW.
Basically, the AM radio is left pretty much "as-is" and the output of a
converter, using an NE602, as fed into it. On a car radio, it's just fed
into the antenna jack, but on a regular AM radio you would feed it in at
the tuning capacitor. I have the schematic and other data in ASCII form;
if you're interested let me know and I'll Email it. Supposedly, it's pretty
sensitive; I haven't built one yet, as I don't have the NE602. (I've sent
for catalogs from a couple sources.)

In article <2E5E2B7F@msmail.uthscsa.edu> MUENZLERK@uthscsa.EDU (Muenzler, Kevin) writes:

>Why would you want such a thing??

For the same reason I build my own transmitters (QRP CW): Just for
the fun of it. Recall I said in my article that the project
was just for fun and not to be taken too seriously (for I knew
I'd get a flame or two).

>Even if you built one you can't receive FM broadcast signals
>on a 2M FM receiver.

Wow. Where'd you get the impression this is what I wanted to do?
The converter is from 146 Mc to 100 Mc not 100 Mc to 146 Mc.

>The deviation is 75kHz wide! If would
>overload your dedicator.

Huh? What's a dedicator?

>You can't go the other way (receive
>2M on an FM broadcast receiver).

Yes I can. I've done it. So far I've been able to hear a &%*$#@ paging
system. I'll tweek it down to 146 Mc - I believe it's in the low 150 Mc
range right now.

>It is designed for the 75kHz
>wide signals. You would have to crank the volume up all the
>way to hear the audio.

Yes, you would think so, but the audio level sounds fine. Don't forget
this converter is in front of a tuner - there's a seperate audio amp
that follows the tuner. In my article *I* mentioned the differences
in deviation - I thought it would be a problem but so far it's fine.

>You DEFINITELY CAN'T TRANSMIT
>ON BROADCAST BAND FM FROM YOUR 2M RIG THROUGH A TRANSVERTER!

You must have had a nightmare last night. This never was my intent.
I'll forward a copy of my original article to you so you can read
it more carefully.

I never mentioned a transverter, only a receiving converter. Know
the difference?

>For one, your rig is not FCC type accepted for that.
>Secondly, you are limited to 1 miliwatt (sic) (1000 microvolts)
>and 3' of antenna if you want to transmit on the FM broadcast

>band.

More hallucinations on your part. I've build a receiving converter
from 146 Mc to a 100 Mc I.F. Nothing was said about transmitting
on the FM bcst band. Also, you might want to peruse Part 15
concerning your statement above.

Also, watts and volts are different units: P = I*E

Recall I said that this project was just for fun and not to be
taken too seriously. Go have a beer, Kevin; it'll calm you down.

Jeff NH6IL (ex WA6QIJ)

2448. AM Antenna question

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-27 00:43:26 UTC
From: seanh@nucleus.com
Message-ID: <Cv64oF.2xq@nucleus.com>
Source record: 116485

Thank you very much, to all those who responded to my question.

Most of you guys told me that in commercial AM receivers, the coil wound around the ferrite rod is used as the pickup antenna. In the radio I told you I was building, I have tried using such a coil in my design, except that this has not given me adequate results. I also tried one from a commerical receiver -- this loopstick was actually composed of two seperate windings on a common ferrite core. Even when I tried to use either winding, I did not get adequate results. so there must be a certain way to hook up these coil properly...? Or perhaps my receiver does not have adequate gain to receive signals from these ferrite coil 'antennas'? Whenever I tried these ferrite coils I didnt even get a signal from the radio.

Thanks again for your help, you've already been quite helpful! If you could spare the time perhaps schematic diagrams could be useful, too.

Source record: 116493

Hi Y'all !!!

I would like to build a crystal-controlled oscillator which can be phase-locked to an input signal. Has anyone done this ??

The oscillator will operate at either 2.4576 or 4.9152 MHz, and must lock onto a 2.4 KHz audio tone (f/1024 or f/2048). Lock-in and tracking range must be +/- 2 Hz (relative to Fin). The input signal is often buried in noise.

Once locked, the oscillator should not drift too far if the input signal drops below threshold - fast lock-up and slow release.

Any ideas ??

Thanks in advance.

ED>If your antenna is a dipole it will be just fine with the 75 ohm line, if a
ED>gamma feed, adjust gamma for 75 ohm feed. I hear you can tune a ringo to ru
ED>with 75 ohm feed also.

That 75-ohm, semi-rigid cable will work just fine without any need to
match it to 50 ohms. The SWR resulting from a 75 to 50 ohm mismatch is
only 1.5 to 1. 100 feet of 3/4-inch hardline has about 1.7 db loss at
440 MHz when matched. With a 1.5 to 1 SWR you will get an additional
loss of LESS THAN 0.1 db!

Here's the best part. If you truly have an antenna with a 50-ohm
feedpoint impedance, cut the 75-ohm hardline to an exact multiple of
1/2-wavelength (taking into account the velocity factor of the line),
and your rig will see a 50-ohm load.

GR>SWR again.

Not so! SWR is determined by the feedpoint impedance of the antenna and
the characteristic impedance of the line, not the impedance of the rig.

If your dipole really has a feedpoint impedance of 75 ohms (don't bet on
that) and is fed with 75-ohm line, Your SWR will be 1:1 and the rig will
see a 75-ohm load. I suspect your rig would not mind this at all and
would deliver full power.

GR>So, all you Dipole Experts, what is the right answer? Yes, this is somewhat
GR>accedemic, since you never really have a mythical Free Space antenna, but
GR>at least you will be starting from a technically sound design.

There really is no "right" answer. You can estimate the actual
radiation resistance of your dipole based on its height above ground in
wavelengths. This information is in most antenna handbooks. It will
undoubtedly be somewhere between 40 to 90 ohms at most reasonable
heights.

The question then becomes: What feedline will give you the lowest loss
while allowing the transmitter to put out full power. The lowest loss
line may not necessarily be the one that gives the lowest SWR. Also, if
the line is not perfectly matched to the antenna, the load that the
transmitter sees will vary with the length of the line, ALTHOUGH THE SWR
WILL NOT VARY.

Since virtually all rf wattmeters and directional couplers are 50 ohm
devices, I would probably go with a low loss 50 ohm line. I would trim
the dipole for minimum SWR. If the rig didn't like the impedance it was
seeing, as evidenced by reduced output, I would adjust the line length
until the rig was putting out full power.

Remember, no matter how perfectly you match the line to the antenna, it will only be matched at one frequency. Tune up or down the band a bit and you will be mismatched. At my station, I accept the fact that I'm going to be mismatched most of the time. So I use ladder line and a tuner. I get low loss and my rig always sees a nice 50 ohm load. ;-)

Hi,

I am interested in building a valve amp myself. Does
anyone knows if there is any docs out there which
will explains how to do it.

Thanks.

2461. Books on RDF antennas, gear...

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-28 21:44:04 UTC
From: ghopper@eskimo.com
Message-ID: <Cv9LpM.M6D@eskimo.com>
Source record: 116501

I have receintly been bitten by the DF bug and after using borrowed gear
for the last few hunts, would like to build some of my own. I have
looked at several books out there and read some of the articles in 73
magazine but owing to the small DF community here in Snohomish county
(if any of you out there are here, call me (206)316-3126)
I am looking for opinions on kits, books and the like. I'd rather not
buy a complete unit since I enjoy putting together new projects. I don't
really have solid preferences yet so I'm open to anything.

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc

Hello,
As the header suggests, I'm looking around for a few published SSTV projects.
The ones I seek fall into two groups:

1) Anyone know of SSTV hardware/software projects that are based on
either Mac or PC systems. Info on Mac-based projects preferred, since I can
get to them more often than PCs, but will gladly accepts suggestions on either
systems.

2) Any published projects involving hardware exclusively meant for
conversion of fast-scan video frames into SSTV-format images?

Thanx in advance,
R. Camama

: Hi Y'all !!!

: I would like to build a crystal-controlled oscillator which can be
: phase-locked to an input signal. Has anyone done this ??

: The oscillator will operate at either 2.4576 or 4.9152 MHz, and must
: lock onto a 2.4 KHz audio tone (f/1024 or f/2048). Lock-in and tracking
: range must be +/- 2 Hz (relative to Fin). The input signal is often
: buried in noise.

: Once locked, the oscillator should not drift too far if the input
: signal drops below threshold - fast lock-up and slow release.

: Any ideas ??

Gee, color TV receivers do this all the time. They get 8 cycles of color-burst (at least in NTSC) once per horizontal scan line. But they typically don't have anywhere near the lock range you want: something like +/- 2kHz at 2.4MHz. On the other hand, there are lots of crystal oscillator manufacturers that sell VCXOs that can cover this sort of range. A varicap in a parallel-mode oscillator that varies the effective crystal load from a very few pF up to 15 or 20pF likely would do the trick. You might want to try to linearize the freq vs control voltage a little, to keep the pll loop gain reasonably constant. Might be nice if you can detect that the sig is below threshold and not drive the loop filter during those periods with garbage noise from the phase comparitor, though if Fin doesn't drift very quickly, then perhaps you don't really need fast lock-up and a slow loop filter would be appropriate.

2464. FSTV: Modifying a Gemini RABBIT for amateur service?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-29 00:46:32 UTC
From: rcamama@dewey.cc.utexas.edu

Build an amplifier with a gain of mu. build a network (attenuator)
to connect the o/p to the i/p with a gain (loss) of beta. The amplifier
multiplies the signal mu times and the output is fed back to modify the
input beta times the output. The output is input*mu*beta. If beta is
negative (out of phase) then the bandwidth is extended, the noise is
increased, the distortion is decreased. (audio). If beta is positive the
bandwidth is decreased, the noise is decreased, and the distortion is
increased (rf). I highly recommend 'high Fidelity curcuit design'by Norman H.
Crowhurst and George Fletcher Cooper, Copyright Gernsback Library, Inc. 1956.

By far the most useful reference I have found is the Transmitter Hunting:
Radio Direction Finding Simplified by Moell and Curlee ISBN 0-8306-2701-4.
The publisher is TAB Books. Written by two experienced and avid hunters, it
covers all you could want to know while being very readable. LOTS of U-build
projects, schematics, ideas etc. Costs U.S. $19.95 (I paid aout $27 CDN) worth
every penny.

[*Empire of the Air* cite deleted]

The "switching" oscillator provides the *quenching* frequency. We have a quench oscillator breadboard attributed to Armstrong in the ARRL Museum.

The main basic "can't do" with the superregen is that it can do heterodyne reception. That lets out CW and SSB demodulation--the reason (well, CW at least :-)) it didn't last in the pre-VHF era. Its broad selectivity also makes it largely useless for narrowband FM, so a superregen is pretty much only an AM and wideband-FM detector.

It's good to see that relatively little traffic on this topic has dwelt long on the issue of how much a regen or a superregen radiates. (Any text that says something like "Don't use those detectors; they radiate" is another case of the specific case, or implementation, being taken as the general case. An RF-amplifierless "direct-conversion" receiver, and likewise an RF-amplifierless superhet with a poorly balanced mixer and insufficient input selectivity, will also radiate, sometimes quite strongly.) A reasonably unliteral RF amplifier stage, along with proper shielding, can take care of detector or mixer radiation in any of these cases. Input filtering (in superhets) also helps.

Data point: The 40-meter regen I published in Sep 1992 *QST* radiates--at a level of roughly 12 picowatts into a 50-ohm antenna load.

The RABBIT works at around 900 MHz and can easily be modified for use on the 33cm ham band. There was an article in the November or October 1993 73 magazine that described the modification and a small power amplifier.

My experience with push pull amplifiers is somewhat limited. My main experience is with the "Plumbers Delight" 2 meter amplifiers that came out in the 60's. Yes they work but it's not easy to get them running and staying running with heat and component drift. The best thing ythat ever happened to 2 tube 4CX250 amplifiers was the paralled designs origionated by Dick, K2RIW, for 432 and later by Fred Murray for 6 thru 220 MHz. They work and are much less touchy to tuneup and keep working. My attention span i
s much too short these days for push-pull amps.

In general, regens DO radiate! The FCC requires that they be CERTIFIED with the FCC before commercial sale, while super-hets only require notification. None of this means a thing as an experimenter building one item for his/her use, but it does imply that history has shown regens to be pretty good transmitters......

Just wanted to say, thanks, Art, for the clear exposition of this.
This explains what I've seen when trying to set up a 40 M dipole, and
makes the fix clear! (I couldn't understand why I saw less output as
trimming brought the SWR down.) Now I know what was happening and,
more importantly, what to do about it.

> amplifier practicality and antenna size. Is 23cm a good
> second choice?

I've just started on EME. I picked 2m because there's more gear
available, and there are more people on 2m EME than other bands.
There are technical reasons (cooler sky) why 432 etc are better,
but if you want to get on easily, 2m can't be beat.

>
>The objective is a station that can hear its own echoes -- not

2477. Looking for 2SK73GR or 2SK77GR

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-29 21:13:40 UTC
From: hpaik@silver.sdsmt.edu
Message-ID: <hpaik.89.2E624F83@silver.sdsmt.edu>
Source record: 116515

I am looking for 2SK73GR for TS830.
I called first Kenwood and give her 2SK73GR.
They did not know what it was, so I give her the part number.
She said it is replaced by 2SK77GR.
It is only 2 dollar something plus 6 dollar something for shipping and handling, moreover she told me that minimum order is $10.
So I called the RCA part store here (replacement FET SK????), but they were out of stock. Is there any other store to get the dual gate FET (2SK73GR or 2SK77GR) by mail ?

2479. More on Receivers that Radiate

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-30 14:10:17 UTC
From: mack@mails.imed.COM
Message-ID: <9407307782.AA778263641@mails.imed.com>
Source record: 116418

David Newkirk's post in digest #258 prompted this post. I have first hand experience with the receiver radiation problem he described. I work in an all metal building which thankfully does have windows. I have an antenna for FM broadcast near one office with a window. My favorite station is 102.9 but several others' favorite station is 92.1 including the person whose office is below my antenna. Add 10.7 to 92.1 and you get 102.8 which completely wipes out my station. I looked at it with the spectrum analyser and the LO from the guy's boom box is 5 db stronger than the signal I am trying to receive.

This should make it obvious why they do not want you to use a portable FM radio in an aircraft where the LO can easily be in the aircraft band.

My experience with cheap boom box type radios and small portable radios has been consistent. They make incredibly good transmitters!

Hi Doug, I don't think David means the PC can't do the filtering. I have
been down the same road and found that an 8-bit A/D needs AGC on the
front end where a 16-bit A/D does not. Saturation is a huge problem in
8-bit systems and the dynamic scaling required eats up a lot of CPU
power. Low dynamic range often leaves one with almost no low-level signal
left to filter. It can be done with 8-bits but the complexity is IMO, not
worth it. A 16-bit A/D gives one a lot of "headroom" and has saved my
sanity. A 2-pole sigma filter gets rid of a lot of noise, too.

Hear Hear! I cannot agree more. Sure, there are lots of examples of crude
superregens that radiate like banshees, but they are just that--crude
receivers. Superregens are superior to 'hets in terms of sensitivity vs.
cost and simplicity, IMHO. Same sort of baseless statements as: MOSFET's
are better than bipolar transistors, RISC is better than CISC, and Coke is
better than Pepsi. Of course, the last is a TRUE statement, but I digress..:-)

: : case. An RF-amplifierless "direct-conversion" receiver, and likewise an

: : filtering (in superhets) also helps.

Very good points indeed. Having direct experience with designing both
types of receivers, I completely agree. A superregenerative transistor
oscillator usually runs with about 200 uA of collector current, while the
LO in most wireless-type superhet designs consumes at least a couple mA.
When both circuits are preceeded by a well designed amplifier with a
decent amount of reverse isolation, say 40 dB or so, the radiated emissions
will meet US FCC, Canadian DOC, and the various european regs.

: : Data point: The 40-meter regen I published in Sep 1992 *QST* radiates--at a
: : level of roughly 12 picowatts into a 50-ohm antenna load.

Another data point, the 315 MHz superregenerative recevier inside the upcoming
Explorer's Remote Keyless Entry system is about 3-4 dB off the noise floor
at 3 meters. I would consider both my design and David's to be "state of
the art" in terms of superregen receivers.

: In general, regens DO radiate! The FCC requires that they be CERTIFIED
: with the FCC before commercial sale, while super-hets only require
: notification. None of this means a thing as an experimenter building one

I don't consider that the FCC only requires notification for 'hets to mean
that they are superior from a re-radiation standpoint! Remember, the FCC
had to mold and shape the broadcast world that we now live in, and their
plan was to make the receivers cheap, simple, and easy to market. The

rule for Notification for the superhet's simply makes it easy to market, and takes them off of the hook of having to tightly regulate all the mfgr's of broadcast sets. The economics and business reasons for this rule are, IMHO, more significant than any technical reasons.

: item for his/her use, but it does imply that history has shown regens to
: be pretty good transmitters......

Seeing that history has spent much more effort improving the superhet, as it supports both FM and AM broadcast, that is not that hard to believe. I have a very thorough collection of superregen articles and papers, and they fill about 6" of file cabinet space. I wouldn't even attempt to collect all the papers and patents re: superhets.

The reason for the regen's bad rap is that in thermionic times (that's toobs to you and me) an RF stage was an extra capacitor gang, an extra tube, and more W of filament power--real product cost/benefit considerations. Now, mass-produced superregens are relegated to wireless control receviers, a job which they do very well, but ultra cost sensitive -- an RF stage adds components, board space, current draw, etc. -- again, real cost/benefit tradeoffs. As wireless products become more complex, you will see them move away from superregens to other topologies that support more complex & compact modulation methods, but only when costs allow and functionality demands it.

But of course, I am biased as I design superregens for a living... I would be happy to correspond with anyone wanting to discuss the merits and pitfalls of this simple, sensitive, and cost effective receiver...

People generally use regenerative detectors to reduce circuit complexity,
which implies that the rest of the circuit should be simple too. For that
reason, most regen's lack an RF amplifier in front of the detector, so they
radiate like crazy.

However, as Dave mentions, it is quite possible to eliminate the problem
by including an RF amplifier with good reverse isolation. Another way
is to use the regenerative detector at an IF frequency, as part of a
superhet receiver: Most mixers have enough isolation to eliminate any
radiation problem.

Do these Rabbit transmitters use any sort of chip (like, MC1317x perhaps)
as the exciter... or are they all discrete ? I'm curious if they would
be mod'able for FM modulation and perhaps highspeed FSK.

After 4 years in storage after a move, I dug out my old Heath SB104A to set up in my new house.

Unfortunately, some bandswitch contacts are only intermittant, and no amount of cleaning has rectified the problem.

Does anyone know of an available equivalent for the following (I only have the Heath part # available...):

S1A & B: Heath # 63-721: 2-Wafer Rotary Switch
S1C & D: Heath # 63-723: Rotary Switch

Any hints on a suitable replacement & where to order them would be appreciated!

>There are technical reasons (cooler sky) why 432 etc are better,
>but if you want to get on easily, 2m can't be beat.

I would also like to know what frequency is the best choice for EME.
Aside from the obvious practicality of generating big power (1KW)
at frequencies about 432MHz, there must be some other factors
such as reflectivity of signals from the moon, and absorption of
signals by the atmosphere.

What about 900, 1296, and 2304MHz? What are some of the advantages
of these over say 2m? Obviously, a high gain antenna is much smaller.

Any info would be greatly appreciated.

Superhets radiate too!! I discovered recently while trying to listen to
a repeater on 444.0 MHz I kept hearing various carriers and noises come
and go as I drove around. They sounded very "local" since often they were
full quieting but they would have lots of very deep fades then disappear a
half mile down the road... then come back... then disappear.

Turns out what I was hearing was the local oscillators in other car radios
tuned to a popular local FM station on 100.3 MHz

100.3 + 10.7 = 111.0 MHz LO frequency x 4th harmonic = 444.0 MHz

With some car radios (mine) you can even hear some modulation from the
FM station way way way down in the noise.

If you have 440 mobile, pick the 440 frequency that matches a local FM
station and see how many car radios you can hear while you are driving
around ;-) You will be amazed! Some of those suckers really put out
some signal!

FM STATION LO LO 4th harmonic

I believe the original problem with using a SoundBlaster is that it
cannot do A/D and D/A simultaneously, or so it is alleged. If you
build or buy a card that can do simultaneous input and output, the
problem is reduced to software. Until then, it stays a hardware
problem. (If you have some way of working around the limitation in
software, please publish it somewhere so everyone else who wants to
try real-time audio on a SoundBlaster can give it a try.)

I'm building the 2m amp project in '73 magazine (Nov '93). The article seems pretty straight forward. I have one question though. For the trimmers, they use ARCO 423's and an ARCO 404. Nowhere in the article does it say what the adjustable capacitance range for the two trimmers are. Does anyone know so I can find an equivalent? Thanks!

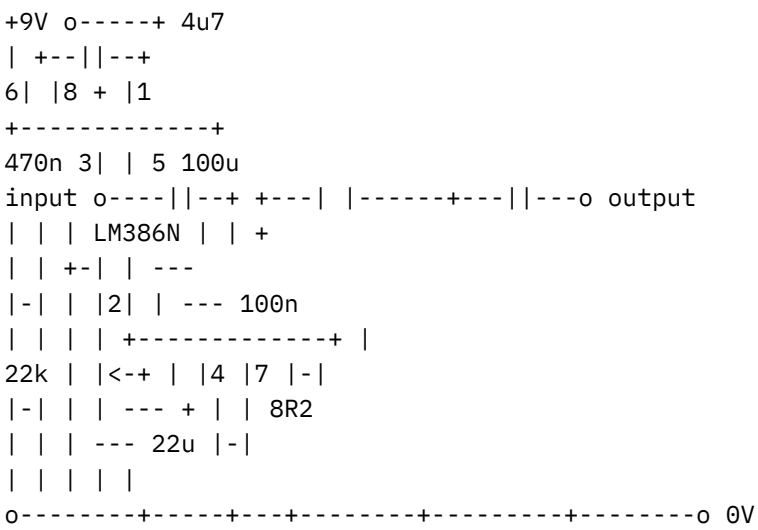
From: dmb@abacus.demon.co.uk
Message-ID: <CvEA0r.1KL@abacus.demon.co.uk>
Source record: 116432

I've put a little amp together to drive a loudspeaker for a homebrew rx, and seem to have a problem. The amp is based around a LM386N chip, with a couple of extra components:



The problems are

1. When I advance the volume control, the amp breaks out into a loud buzz, and locks up until it's powered off again. The point at which this happens is always the same, but depends on the rate that the volume is advanced at. If i whizz thru this point, it remains stable, but breaks out into a buzz when the control is fully advanced. This is the case whether there is input to the amp or not.

2. If I connect an antenna to the central point of the vol. control, I get very solid breakthrough of local radio stations.

3. In any case, the amplifier doesn't amplify (major drawback :-))

4. Although it's a new component, the volume control sounds scratchy. I don't *think* it's worn, but this is possible I suppose.

I've checked the connections thoroughly, swapped the chip for a similar one (LM386-1), and visually checked the caps (I'll put a meter on them if I decide to strip it down and rebuild).

Is this one for the bin, or can anyone suggest anything else to test ?

73

David

PS, I'm off on hols on Thursday, any responses after this would be appreciated by email.

2495. Re: FSTV Modifying a Gemini RABBIT for amateur service?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-08-31 17:20:58 UTC
From: ka7oei@uugate.wa7slg.ampr.ORG
Message-ID: <6898@uugate.wa7slg.ampr.org>
Source record: 116435

The RABBIT transmitters that I have seen are free-running oscillators centered on approximately 915 MHz. It runs standard AM + audio subcarrier video modulation. This is because the "receiver" is simply a downconverter, taking the transmitted signal and shifting it down in frequency.

Since it runs AM (I'm not sure if they even bother with VSB filtering... I doubt it...) it is not directly FSKable. Because of their AC coupling, they are probably not even suitable for direct ASK, either.

Of course, if you wanted to use this as foundation for such a transmitter, one would want to note that if it is indeed a free-running osciallator, one woule expect it to drift several hundred KHz, at least! This will hardly bother a video signal, but with the data rates you are likely to be able to handle over the air (<couple megabaud) some sort of frequency stability or receiver tracking would be appropriate. A free-running oscillator is very easy to FSK. One would want to shape the data prior to modulation as well.

As for the receiver, you are on your own. You may be able to use the original downconverter (I don't know if it has a free-running LO or not) to get the signal down to a reasonable frequency. For data rates <1 megabaud (it is actually rated to 500 kbaud) the MC3356 is a good choice: It contains its own LO, mixer, limiter, discriminator, and slicer. A similar circuit is the MC13055. It is similar to the MC3356 except that it doesn't have the LO or mixer, and its Discriminator/Slicer has been modified to work up to 2 mbaud (it has been pushed to 10 mbaud experimentally)

The point being, is that either of these chips can be operated at the original output frequency range of the converter (70 MHz or so - the Channel 3 or 4 region). Good luck in finding either of these chips, though. I'm given to understand that they are in chronic short-supply. As a possible substitute, the NE604 (or even the NE605) has enough discriminator bandwidth to allow it to operate at several hundred kbaud. You'd need to supply your own slicer, but if you already got as far as putting the '604 online, adding the LM311 as a slicer would be trivial...

What is *not* trivial (and appears - to me at least - is that the need for some-thing that can operate at those dreamed-of baud rates is glossed-over. Keep in mind that most things (TNC2 with the super-fast, killer clock speed option) is unlikely to work much above 56 kbaud, as is the Data Engine. Your choices appear to be (at least in current context) are, in rough order of handling high-speed data, are the PI2 card, the Gracilis PackeTwin, and the Gracilis PackeTen. The former two can reputedly handle several hundred kbaud, while the latter can handle well over a megabaud of sustained throughput on its multiple ports.

One final thing about a rabbit-for-data is that the data exchange needs to go both directions. Would one plan to "key" the rabbit transmitter? Certainly, it wasn't intended to be keyed at all (most video modulators take 10's to 100's of milliseconds to stabilize...) so I suppose that a full-duplex system was implied. If it is with exactly one other station you wish to communicate, then full-duplex is precisely what you need and should work toward.

If you wanted to use the "rabbit transmitter" as a hub of a multiple-access data network (slightly similar to 'hubmaster') then you'd have to work out that set of details, too... (i.e. what the "return" frequency ought to be, the data rate, protocol set, etc...0

VIDEO CONFERENCING OVER HAM RADIO

For those not familiar with SSTV, it allows you to enhance your
communications by including full color images. Instead of JUST TALKING
about a new boat, pet dog, grandchild, or whatever, you can exchange
full color pictures over ham radio using a voice transceiver.
A few years it cost kilobucks to buy special purpose equipment.
Today you can get started with a PC, a few $ of parts from Radio Shack
and free software. It's fun. It's interesting. It isn't expensive anymore.

Now back to the question ....

I try to keep up on everything happening in SSTV and never heard of anything
for the Mac. There have been a few homebrew SSTV projects for the IBM PC
the last couple years:

73, August 92 - ViewPort VGA
QST, January 93 - Pasokon TV
QST, January 94 - Vester

For more background on SSTV, products available, a bibliography, etc.
grab a copy of /pub/ham-radio/sstv_wefax_info from ftp.cs.buffalo.edu.
I'll gladly e-mail a copy to anyone to can't snatch a copy by ftp.

For a reprint of the January 93 QST article, send an SASE to:

John Langner
115 Stedman St. #U
Chelmsford, MA 01823-1824

>
>2) Any published projects involving hardware exclusively meant for

>conversion of fast-scan video frames into SSTV-format images?

The articles mentioned above only deal with sending and receiving images with voice transceivers. They do not address the problem of getting video (from a TV camera) into the computer. You will need a framegrabber to do this.

I found out last weekend that the mysterious audio noise marker
generator that I had been hearing on 2 m was actually my CD-boom box!
Every 90 kHz a nice bit of noise. Anyone know what it might be?
servo-positioner for the laser diode, maybe?

Ok Gene, let us know how you make out. Remember that your forward power
may decrease as your SWR is lowered, even if the rig is putting out
full power. True power is forward power minus reflected power; that's
what you want to maximize. As you lower SWR, both the forward and
reflected power will drop.

2500. Pocket SW Receiver Design

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-01 00:51:41 UTC
From: zelle@cs.utexas.edu
Message-ID: <3438it$ah1@phobos.cs.utexas.edu>

I started a recent thread on regenerative receivers which eventually turned into an interesting discussion superegenerative sets. I also got a number of very interesting direct responses, however, all the info has lead to more questions. So I would like to pose a more general question to the wisdom of the net. Namely, what type of receiver would you recommend for a small portable shortwave. Here are the general design specs I'm working under:

(Relatively) small parts count. I want to keep it small with simple "ugly" construction. (I don't like etching boards). Low battery drain. Simple, reliable design (easy to get working without sophisticated test quipment as I still build these guys without a scope). Enough sensitivity to receive moderate to strong international broadcasters with only a short makeshift antenna. Enough selectivity that I have a reasonable chance of single-signal reception in the international shortwave bands. Frequency coverage need only be one band (probably 49 meters), but others would be a plus.

Here're some design ideas to get the ball rolling:

Superhet: It's been argued that no alternative (regen, super, dc) can give similar performance. But... It would have to be dual conversion to eliminate images. Perhaps a couple of NE602s? Would simple LC filtering of a couple of IF stages give sufficient ultimate selectivity? What about using ceramic filters, first stage 10.7 Mhz, second 455Khz? Doesn't sound very simple. I've built nice sets, but those designs are not suitable for a portable.

Regenerative: Smaller parts count, but there seems to be broad disagreement on whether selectivity would be adequate at 5-10 Mhz. Additional advantage of allowing multiple bands by simply switching a single tuned circuit.

SuperRegen: Don't know too much about this. Any pointers to possible design articles? What is the advantage over regnerative?

Direct Conversion: Simple design, audio filtering easy. But... A free-running VFO will not be stable enough for good-quality AM detection without frequent retuning (I know, I've built some very good ones, but any tiny drift really beats with the carrier and ruins the audio). What about phase-locking directly to the incoming signal (is that synchrodyne?). I've never designed with phase-locked loops, so pointers here would be very helpful. Is it feasible below 10 Mhz that there is some off-the-shelf chip which would provide suitable VCO and phase comparator? Is it easy to get sufficent VCO range and small enough locking range that neighboring signals could actually be

independently captured, or would strong signals hog the PLL?

Those are the ideas. I'm particularly interested in the Regen and synchrodyne ideas. I would especially appreciate ideas on the latter. Has there been a construction article for a synchrodyne receiver? If the general wisdom is that only a superhet will suffice, that's the way I'll go. I just don't have time to try everything.

This is a bit of a long post, but I hope it will generate some interesting discussion of possible designs.

Since questions seem to come up rather often about ARCO caps, I am posting the following chart of ARCO type and its capacitance range. Hope this helps since a lot of construction articles give the type without any clue to value.

Circuit Specialists (800) 528-1417 (602) 464-2485 in Arizona stocks most of these units.

Type Value Range - pf

Minature Trimmers (Type 40)

400 2.5 - 7
402 4 - 20
403 8 - 45
404 12 - 65
405 16 - 90
406 25 - 115

Minature Trimmers (Type 42)

420 2.5 - 12
421 3.5 - 25
422 7 - 40
423 16 - 100
424 25 - 150
425 40 - 200
426 55 - 250
427 75 - 300
428 95 - 350
429 115 - 400
4210 130 - 450
4211 150 - 500
4212 170 - 550
4213 200 - 600
4214 220 - 650
4215 240 - 700

Standard Trimmer (Type 46)

460 3 - 15
461 5 - 30
462 10 - 80
463 20 -180
464 45 - 280
465 75 - 380
466 105 -480

467 140 - 580
468 175 - 680
469 215 - 790
4610 260 - 900
4611 300 - 1000
4612-1 330 - 1100
4613-5 360 - 1200
4614 380 - 1305
4615 420 - 1400

2508. Enclosures for Xmitters & Amps

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-01 21:38:06 UTC
From: frbspd@crl.com
Message-ID: <345hju$ggm@crl6.crl.com>
Source record: 116446

We are making extruded aluminum enclosures available for the building of small transmitters and amplfiers. The enclosure has a built-in heat-sink that will handle up to around 30 watts without any problem. It is comprised of an extruded channel 6 inches long, 3 1/2 inches high and 4 3/4 inches wide with a mating extruded lid (your basic brick). Blank end plates are supplied for in and out connectors or you can request plates punched for S0-239 on either or both ends at no additional charge. Internal to the enclosure, there are horizontal slots down the inside walls. One can easily mount an exciter on a flat piece of aluminum and slide it in with the power amp mounted below. It works very well with the hybrid amp modules. Cost for the enclosure is $30.00

One of our PLL designs is being reset to work at 2 meters, it puts out 1/2 watt which will drive most of the 5 to 30 watt modules very well. This will be available as a kit for $95. Further, we have 6-8 watt, 15 watt and 24 watt amplifier kits which only require 1/2 watt drive, at most.

Our work primarily consists of designing and manufacturing low power, low cost FM transmitters for native and community broadcasters outside the Unites States. We do what we can to encourage and keep the spirit and practice of hands-on and homebrew alive.

This size/# of parts restriction would severely limit your choice.
I could be wrong, but in my opinion you really have to stick to a
very simple design if you use "ugly" or "dead-bug" construction
because even a single-superhet AM broadcast receiver built this way
would not easily fit in your pocket. On the other hand, sensitivity
and frequency coverage would be no problem if you only want to
listen to strong SW stations.

> I've built nice sets, but those designs are not suitable for a portable.

Designing a narrow LC filter with discrete components is not an easy task,
as I remember having a rather hard time building a 5-pole BPF with 100kHz
BW even with a network analyzer. On the other hand, ceramic filters
are readily available, small, and convenient. These are also available in IF
other than 10.7MHz or 455KHz, for example, 4.5 ot 5.5MHz. So, for double-het,
you can use one with 150KHz at 10.7MHz and another with 6 or 8KHz BW at
455KHz. By the way, there are several ICs with mixer, diode and
ring detecters, gain stages and more that will make your design simple.
Suggestion: go get a simple shareware PCB design software and etch your

own board. It's not that bad. (It's much better than making pattern from
the scratch all by hand as I used to do in the past.)

I'd rather call this a radiator or a jammer. Once built a VHF one and
found it causes much more TVI than my 100W TX on 10m. Then again, I don't
know much about these guys as I gave up on them so early.

Maybe the best concept in simple receiver design and also the best candidate
for yours, if PLL is simple and easy for you. As I understand, PLL was
developed for the homodine (or synchrodyne) receivers which is an ancestor
to the direct-conversion receiver. I once saw a one-chip AM synchronous
detection receiver based on NE562 (or 564?) PLL chip, which was amazingly
simple. VCO range and locking wouldn't be a problem over 1MHz segment
at HF.

> Those are the ideas. I'm particularly interested in the Regen and synchrodyne

Back in the days of WW II the German U-boat crews would tune receivers to
Allied radar frequencies to see if there were any planes or ships near. The
Allies retaliated by turning their radar off and listening for the
oscillators in the U-boats' receivers. Apparently this worked well
enough for the practice to be used during the rest of the war.

In the days of VHF AM, T-hunters would quite often listen for the signal
being radiated by the superregen receivers on the infamous Heath Twoers
and Sixers as they got close to the target.

I would be interested any other interesting stories along the same line.

What are people using for power amplification on EME? I'm looking at 2m or 432, and trying to keep the costs down somewhat. How much power are you using, and what is your amp... homebuilt, surplus, used....?

You should have around 1KW, so the device has to be 3CX800 or better. Recently
there are good and cheap russian tubes appearing on the market. The other
expensive component of cause is the transformer, Try to find someone who
has started to build an amp, lost interest and sells the components.

Is there a U-shaped waveguide in the ocean due to the temperature and salinity stratification (and association changes in electrical conductivity and c) that would cause radar and acoustic waves to turn? If so, does anybody know what the length and turning depth scales would be for different frequencies, polarizations, and depth profiles? Probably whale and dolphin frequencies are an important subset or the acoustic set, and the radar frequencies or even infrared frequencies might be important for certain biota.

Source record: 116455

Has anyone had luck building a helical resonator filter at VHF? I have the design equations, but it appears that the design may be to unforgiving for simple construction. My requirements are 160 MHz center frequency with a 2 MHz 3 dB BW.The stopband slope should have frequencies at 158 MHz down >50 dB. Has anyone had luck designing and building similar filters?

: Bill "TVI, nuthin!"

Most likely it is a bit of the clock that is used for the serial input
D/A converter. The base frequency is 44.1 (I think) so that would a 2x
oversample clock of 88.2 kihz. Most likely a bit of coperclad carefully
placed around the D/A converter area would fix it up fine.... No guarentees
by the way ;-)

John Marvin Zelle (zelle@cs.utexas.edu) wrote:
> question to the wisdom of the net. Namely, what type of receiver would
> you recommend for a small portable shortwave. Here are the general design
> specs I'm working under:

I occasionally drop everything and take off travelling, living for a
year or so out of a daypack. A shortwave radio is nice to pack,
especially if you can't read the local newspapers.
My criteria are:
small and light as possible
cheap and replacable (so I don't spend my time guarding it)
dependably receives major broadcasters (usually the BBC)

Last time out I travelled with the smallest comercial job I could find.
But I have been thinking I could do better.

A small shortwave to AM broadcast converter could be built with little
more than the Phillips NE602, a crystal, and a tuned antenna coupler.
With surface mount parts, it could be the size of a fingernail.
If the crystal is around 8.5Mhz, could choose between the 31 and 41
meter shortwave bands by retuning the antenna coupler.
A 6.0 Mhz crystal would hit 60 and 41 meters.

The converter would be coupled to an AM broadcast band radio by winding a
wire around the AM radio's ferrite loop. Since the converter would be
under crystal control, the radio must be tuned. The radio is shielded
from local broadcast band stations by wrapping it in tinfoil (with holes
cut for the controls).

Alternately, we could pick a dead spot on the AM radio and tune the
converter (doing away with crystal control). But that would make the
converter much bigger, and would not be as stable.

Small AM broadcast radios are usually easy to replace anywhere.
Since the converters are so small, could carry a half dozen of them.
Pack them in different places, so it is unlikely that you should ever
loose them all. Could hand them out to aquaintences. And they would
make for interesting conversations with bored spy-crazy inspectors at
isolated frontiers.

Automobile radios would also be ideal for use with such a converter,
they are always well shielded to avoid ignition noise. Seldom hear
anything when the antenna cable has been disconnected. Shortwave
reception in the car could be very nice, especially if you often travel
through regions not covered by comercial broadcast stations.
Unfortunately, those dang digitally tuned units that are in most cars

now take so long to recover when changing frequency. Would be really aggravating to tune across a shortwave band with one (or a comercial broadcast band, for that matter).

If you wish to build a complete radio, I would think that such a converter followed by a regenerative detector would be fun to play with. The oscillator on the converter would be tuned, not crystal controlled. The detector would operate at a constant frequency, perhaps 1 Mhz. A bit of LC filtering in front of the detector would help avoid overloading it. Since the detector is operating at a reasonably low frequency, selectivity can be very good. As a bonus, Amateur CW and SSB signals can be recieved.

Rumor has it that Digi-Key is selling the NE602, though I assume that is only the DIP through-hole version (I don't see it in their catalog). Arrow sells all the Phillips parts (including the surface mount NE602AD), plus the Intel, Lattice, Motorola, TI, AMD and Quality Semi lines (and plenty more). The hitch is that they have a $50 minimum/order, $25 minimum per line item. Anybody know of any other sources?
The NE602 should run about $2 US each.

BTW, I have tried to post this before, but don't think it got out.

> of these over say 2m? Obviously, a high gain antenna is much smaller.

Absorption tends to become more noticeable up around 4 GHz and above.

The surface alignment requirements of parabolic antennas become more critical as the frequency increases, i.e. wavelength decreases, and hence one has to pay more attention to correctly shaping the parabolic surface.

On a slightly different note ...

I'm still kicking myself that I never had the opportunity to attempt moonbounce at 12 GHz. I had available (for a while) a 14 metre diameter Cassegrain-fed parabolic dish - gain = 64 dBi, G/T = 38 dB/K - and two 7 metre diameter Cassegrains which weren't carrying traffic. The problem was that I could only muster 50 W at 12 GHz. Now, if I'd had a 14 GHz LNA at the time, I could've put 2 kW up (or 4 kW if I phased the amplifiers at the input). All antennas were fitted with computer controlled tracking systems so that following the moon would not have been a problem.

However, numerous discussions with my colleagues indicated that the moon may very well absorb all incident 12-14 GHz radiation. Hence, the attempt became uneconomical to try ... however, it would have been interesting :) And, I was just too busy with other things ... like work!

Wow. That's a 10 pole filter with 1.2% BW. It's going to have a lot of
insertion loss unless you get the unloaded Q well into the 1000's. You'll
need to make the filter quite large to do that, several cm. in diameter.
Also, you have to wind the coil on a mandrel to get very uniform spacing
and diameter, or the Q will plummet.

All,

I'm planning to replace the realy on the Ramsey 2M amp (kit) with a PIN diode circuit and am looking for some info. In the ARRL Handbook, there's an HF TR switch using a Unitrode 1N5767 that's supposed to handle 100W according to the text.

1) When I try to cross the 1N5767, I get an ECG717, general purpose diode. The only PIN diodes the catalog shows are an ECG553 and 555. Does anyone know if these are acceptable replacements.

2) I plan to scale the HF design to VHF and was wondering it there are any "gotcha's (besides the standard layout considerations ,short leads, etc) when using PIN diodes in the VHF range.

Any inputs would be appreciated

2525. Pocket SW Receiver Design

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-02 23:21:28 UTC
From: ka7oei@uugate.wa7slg.ampr.ORG
Message-ID: <7785@uugate.wa7slg.ampr.org>
Source record: 116465

Hmmm... That sounds like a fun project.

I would have a tendancy to go with a semi-up-conversion receiver.

A simple (albiet not really high performance) receiver could be constructed using an NE605 (I think that that is an NE602 and an NE604 clanged together in one handy-dandy package...)

In this case, use a 10.7 MHz IF.

Some reasonably narrow (for AM, anyway) and inexpensive monolithic crystal filters can be obtained for 10.7 MHz (heck, you can order a bunch of $0.89 crystals from Jameco and make your own, if you want it <4 KHz or so... Not for 10.7 MHz, but for others...) Digi-Key has some filters for 12.5 KHz spacing that are on the order of 10 KHz wide or so (get a pair of the "2 pole monolithics" and cascade them - they are about $5.36 each in the current catalog) and have a decently sharp, but listenably wide IF.

A 10.7 MHz IF would put your image 21.4 MHz away (you would obviously have to use high-side injection for almost anywhere on HF) but if you are putting int on 49 meters, then a 16.5-17.0 MHz LO would be in order.

If you wanted, you could expand the range of the LO (as a VCO, maybe... use an NTE618 hyperabrupt tuning diode and you can get almost an octave of unswitched VCO range... at the sacrifice of stability, though...) Gee... you could make this do-hicky cover 10 meters and (ICK!) 11 meters at the same time, with the same 49 meter LO...

For AM detection you could use the RSSI (Received Sig. Strength Indicator) output of the '605 (it has a good log curve of almost 90db!) if you didn't mind a bit of audio distortion, or a simple envelope detector could be used.

Hey, you could even have an "afc" in there... use the `605's discriminator and make it "lock" on to the carrier of the AM signal and help compensate for drift...

Oh, and the RSSI could be part of your AGC circuit...

The '605, like the '602 has a fairly fragile mixer. It will be easily crushed by 500 kw shortwave transmitters, but its noise figure (<6db) is unnecessarily low for low HF if you are using a decent antenna. If you are using a telescoping antenna, then perhaps it is just fine...

Also, the '605 pulls on the order of 10 mills by itself. It has its own LO that may be free-running, or it can be xtal controlled with overtone or fundamental-mode xtals. You may be able "rubber" your LO xtal for 50 KHz and cover your interested part of the 49 meter band in a small number of xtals

with relatively good stability...

Well, I'm starting to ramble, but an up-conversion single-conversion
HF receiver would work well, I think.

If you do use an external envelope detector, just make sure you put it before
the limiter:-)

> Ed@fore.com
Ed,
I recently built the Ramsey 2m PA-1 and relay. The amp seems to work
fine. I run mine from my car (direct to battery) and use my HT to drive it.
My HT puts out about 0.5 watts on low power, and this gets amplified to 10
watts at the output of the amp. The relay circuit is kind of touchy with
this low of drive - they spec a low drive mod, but I didn't do it. On
high power my HT puts out about 5 watts that is amplified to close to 40
watts. I don't have lab spec readings on the power out - just my cheap
RS 2/440 SWR/POWER meter.

My biggest complaint - there is no provision for mounting the &*^%*&
circuit board!! I suppose this is to allow "a wide variety of mounting
options" but I see it as a pain!

Just my $ 0.05 (that's $ 0.02 + $ 0.03 for taxes).

There's nothing wrong with having the signal on the air have a much
higher baud rate than the computer/TNC interface. The computers will
catch up in time. Until then, having fast packets and slow computers
means the modems need FIFOs in hardware or software. In exchange, you
get more computers on a channel and fewer bottlenecks.

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew,rec.radio.info

Periodic Announcement - ARRL Email Information Server (info@arrl.org)

The services that the ARRL provides via the internet include the
Email Information Server and the Technical Information Service.
The Information Server is an automated mail server that gives you
access to many of information files relating to various facets of
Amateur Radio. You can retrieve any or all of these files by
sending an email message to info@arrl.org here at ARRL HQ.
Each file you request is then mailed to you automatically.

To use it, mail messages to:

info@arrl.org

Each line of the message body should contain a command as shown below.
The subject of your message is not processed and may be omitted. You
may place as many commands in a message as you want. The files you
request will be sent to you in separate messages. Only ASCII text
files are supported.

Valid INFO commands:

reply <address> (may be needed - see below for explanation)
help
index
send FILENAME (example: send prospect.txt)
quit

In the above message example, "help" retrieves a brief set of
instructions for info, "index" retrieves a list of available files
and "send prospect.txt" retrieves a text file containing information
on becoming a radio amateur.

Note to users with FTP capability: All of these files are also
available by anonymous ftp to oak.oakland.edu in the
pub/hamradio/arrl/infoserver area. Retrieve the file index.txt
in the /league sub-directory for a complete listing of available
files.

If you want to retrieve several text files with one message, use a
separate line for each "send filename" request.

Your From: field or Reply-to: field in your header should contain a
valid Internet address, including full domain name. If your From:
field does not contain a valid Internet address, the answer will not
reach you. If this is the case, then use the reply command as shown

above. When needed, this command should always be the first command in your message.

IMPORTANT: Please use the quit command in your message. This will prevent processing errors from message signatures.

PLEASE NOTE!: This is an automated system not capable of handling written requests. Any questions on the info-server or the content of any of its files should be directed to mtracy@arrl.org.

ALSO NOTE!: Do *NOT* reply to messages sent from info@arrl.org - the reply address is redirected to keep bounced messages from endlessly looping. Write a new message to info@arrl.org instead.

The Technical Information Service gives League members on the internet better access to the knowledgeable technical staff here at ARRL HQ. Questions relating to Amateur Radio and related technical topics are welcome. To use this service, send a normal e-mail message to tis@arrl.org with your question spelled out in plain english. For best service, be as specific as possible and keep your line length in messages to a maximum of 80 characters. Due to personnel limitations, priority will be given to questions from League members.

Best Regards,

Michael Tracy, KC1SX, ARRL Technical Information Services Coordinator
(e-mail mtracy@arrl.org)

Sample of files available from INFO: (There are lots more!)

Note - If you are not yet an Amateur Radio operator retrieve the file prospect (send prospect) for information on how to easily get started in this fun hobby.

2531. Miller coil form; HEP-2 xsistor

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-03 03:58:45 UTC
From: jeffrey@kahuna.tmc.edu
Message-ID: <CvJCDy.A04@news.Hawaii.Edu>
Source record: 116370

I'm building a 25 MHz VFO from an older book; the author calls for all three inductors to be wound on a J.W. Miller #4500 coil form; Does anyone know the outside diameter of this form so I can find a substitute?

He only states the number of turns of #30 wire (close wound) without giving any other details (not even the inductances are given!)

Oh, while I'm here, can someone provide a `modern' replacement for an HEP-2 (= GE-1) transistor? The VFO uses three of these older pups.

Thanks so much.

Jeff NH6IL (ex WA6QIJ)

2532. 1750 meter station list???

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-03 14:51:05 UTC
From: robb873302@aol.com
Message-ID: <34a2gp$g6f@search01.news.aol.com>
Source record: 116372

Does anyone have a list of 1750 meter stations? I've seen bits and pieces around but nothing comprehensive.

Thanks - Rob, N1NTE (email - RobB873302@aol.com)

2533. WTD: Xtal oscillator for 6M AM rigs

Newsgroup: rec.radio.amateur.homebrew

Ranson J. Pelt (pelt@vt.edu) wrote:
: Does anyone know of software to develop circuit boards designed for the Mac???

: --
: Ranson Pelt
: pelt@vt.edu
: nz4i

Since this may be of interest to others, I'll post it. There are at least two I know of that are still producing for the Mac:

McCAD Series
By: VAMP
6753 Selma Ave.
Los Angeles, CA 90028
(213) 466-5533
They've been around for many years, and their stuff runs from $400 for bare-bones, to about $4,000 for full-blown rip and retry autorouting.

CAD/CAM Professional
By: Douglas Electronics
2777 Alvarado St.
San Leandro, CA 94577
(510) 483-8770
They're primarily a pc board house, and wrote this software to help drum up business. Their software comes with a utility that'll dial their pcb fab and get you an immediate quote on the board you've just drawn up. Click a button, and it'll download the order -- and they'll ship to you when it's done. Schematic capture and route software is around $3,500.

In addition, there's a company in Canada that produces a pretty comprehensive schematic capture and digital simulation package for the Mac, called DesignWorks. I've used it for years with pretty fair results.

DesignWorks
By: Capilano Computing
406-960 Quayside Drive
New Westminster, B.C., Canada, V3M 6G2
(604) 522-6200
Their software will generate netlists for all the popular pcb layout applications, including those for the PC. I believe it's around $500 - $1,000. Since one package they used to work with was recently discontinued, they may be keen on fitting you with whatever else is out there (ie., they'd know what was available).

Call them...

And now, I've got to get my $0.02 worth in. I'm an electrical engineer, and have tried (for years) to hang on as one of a mere handful who use Macs for engineering. I bought Protel's AutoTrax pcb route application with DesignWorks schematic capture a couple of years ago, and Protel has since discontinued both sales and support of their Mac software. They've decided to pursue the Windoze market. In addition, I bought Claris CAD for the Mac, and it's since been discontinued. The writing on the wall, folks, is that Apple isn't subsidizing or pushing the Mac as an engineering machine, and engineering software companies are walking away from the Mac. Apple was to pump money into Autodesk's AutoCAD for the Mac platform, and word is they backed out. In the mean time, big bucks are being dumped on the multimedia and graphics software firms. Don't be fooled (as I was): Apple has apparently no intentions of pursuing the engineering market. Buyers of engineering software beware. I spent around $3,000 for pcb software that won't run under system 7, and has some fatal bugs that won't ever be fixed. No amount of money will buy me an upgrade. How much will you spend?

2536. 10 meter amp?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-03 23:06:11 UTC
From: greendot@lamar.ColoState.EDU
Message-ID: <34avh3$3dpt@yuma.ACNS.ColoState.EDU>
Source record: 116376

I have a ten meter amplifier, not sure what brand but it uses 1 2sc2290 and 4 2sc2879 finals. The 2sc2290 drives the other four. My question is if the driver final (1 2sc2290) was going bad would it cause the amplifier to throw out of frequincy??? My swr will sometimes be good about 1.4 and then will go to about 3 and the amp will heat up very rapidly. Just a week ago it was working fine with a low swr. Any advice would be greatly appreciated!!
Thanks Robert

> I would be interested any other interesting stories along the same line.

Back home I once had a brief look through Peter Wright's "Spycatcher" detailing the author's experiences with MI5. (Can't read it here - it's banned :-))

He tells of using the same method to detect receivers in Russian embassies, and also to locate the presence of Russian "illegals" in Britain. Initially they drove around the suspect areas in specially-fitted out vans. Then they fitted an aircraft with the necessary gear, and flew around at night listening for LO's!

Apparently they upset the CIA something fierce when they presented a variant of the system to them - it appeared that MI5 had kept the technology from the CIA for a number of years.

2538. GMSR radio to 70cm?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-04 17:38:09 UTC
From: lakki@krksun.krk.fi
Message-ID: <1994Sep4.173809.4376@krk.fi>
Source record: 116377

Hello!

I wonder have anyone tried to modify a GMRS - handie talkie to 70cm?

Are the radios for GMRS crystal controlled or what?

The price rate, abt $100 seems to be a right rate for a 1ch 70cm radio,
to monitor and operate a local repeater.

Please e-mail if you know anything!

/Erik

: dB. Has anyone had luck designing and building similar filters?

There are a set of bandpass filter designs for the Amateur VHF Bands in the last (1994) Eastern States VHF conference proceedings, which ought to be available from the ARRL Publication Sales Deparment. One is a 222 MHz 1 MHz wide filter, but this filter has only 2 sections. You need at least 5 sections to meet your requirement. There is a techique by Dishal outlined in Zverev's filter book for tuning these up without a sweep setup.

No. The problem is that the 8 bit SB cards cannot do simultaneous input
and output. By not being able to do real time processing, I meant that
you could read a signal in, process it and output it, but couldn't
output it as you were reading in.

> out of frequincy???

The driver by itself is probably not a problem, as it is a single device stage. Sounds like the other units are in parallel, so one of those dropping out would probably result in reduced output. Dry joints in tuning tanks, etc., will cause problems, but again, reduced / no output will most likely result.

I'd try the suggestion below first ... it's easiest to eliminate, and could save a lot of head-scratching:

> My swr will sometimes be good about 1.4 and then will go
> to about 3 and the amp will heat up very rapidly.

I'm not surprised! :-)

> Just a week ago it was
> working fine with a low swr. Any advice would be greatly appreciated!!
> Thanks Robert

Sure it's not an intermittent problem with your antenna system? By "antenna system" I mean *everything* from the antenna port on your SWR meter through to (and including) the antenna.

I had something like this with a Swan 500 C once - eventually I pulled down the antenna (a dipole) and found a dry joint in my homebrew balun. One touch with the soldering iron solved the problem. :)

A suggestion: Next time you have the problem, QRT, disconnect the antenna cable from the SWR meter, and put a dummy load there instead. Transmit, and see what you get for VSWR & output power. I'd swap back and forth a few times between antenna and dummy load just to check that disturbing the antenna cable connector doesn't "fix" the problem.

The results of this test will at least isolate the problem to one of two parts in your set-up.

Feel free to email me at michael@arkas.demon.co.uk if you have questions, etc.

I'm not a great user of Mac's, but one question that I've never thought to ask: do Mac's have a feature that equals the processing power of an intel floating point processor? I ask this because I'm wondering if a Mac could do "hack" work for low speed control systems, DSP, phased array antenna control, etc.

I've always used ibm clones for eng. work - I currently have a 486dx2/66 with 8 MB RAM purely as a "home-use" eng. machine to run antenna modelling software, etc. This involves much manipulation of large arrays containing double-precision floating-point numbers, and hence takes time. More RAM will be added (up to 32 MB) as money allows. :)

Subject: RFI Free PC Computer Cabinet?
Newsgroups: rec.radio.amateur.equipment
Organization: NETCOM On-line Communication Services (408 261-4700 guest)
Summary:
Keywords:

Over th e past several years, I have tried several different PC compatible computers in the shack in an attempt to use with my HF Station. It seems no matter with PC I have tried, and having tried toroid chookes, ac filters, etc. my PC (now a 486 /66) still QRM's the heck out of the ham hams with birdies and other annoying noise.

I know my PC is not a CLass B machine, just a clone. But over the years, I have had several clones, real IBM's, Compaqs, and AST's all with basically the same result.

Does anyone out there know of a manufacturer of a PC tower or desktop cabinet that has excellent RFI suppression and shielding? If so, would be very interested in finding this out.

Short of spending magabuck for a new class b machine, is there any other solution? My pca nd my hf station are totally useless together. What does all you guys do?

Thanks.

2545. Amplifier with GS35 Triode

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-05 10:07:03 UTC
From: M.Willis@ee.surrey.ac.uk
Message-ID: <1994Sep5.100703.19027@ee.surrey.ac.uk>
Source record: 116393

I am looking for a design using the Russion gs35 Triode on 432 MHz. This valve has an anode dissipation of 1500W and is usable up to 1 GHz. It seems ideal for QRO work at 70cms. What I do not have is a tried and tested design for it. I can make a first attempt using a modification of an exisiting design for another valve but, I am sure a lot of optimisation would be necessary. As I have only got two valves, I do not want to do any destructive testing. I have some limited valve data, including capacitance and operating parameters, but nothing on cooling requirements or gain and stability expectations.

>enough for the practice to be used during the rest of the war.

I recently read a book titled _A_Race_on_the_Edge_of_Time_ which follows
the development and use of radar during WW II. The author relates how
airborne radar units had a significant impact on the Battle of the Atlantic
because surfaced German subs were almost impossible to spot visually at
night. While the radar units of the time were not sufficient to guide a
torpedo/bombing run against the sub, it was sufficient to get the patrol
aircraft in position to use a high-power searchlight.
To counter this, the Germans developed a RWR (radar warning receiver)
and could get under water in less than a minute. To counter this, the
Allies changed bands, moving to a higher frequency. This allowed them to
start catching subs on the surface again. The Allies successfully spread
the story of a new piece of equipment that detected the RWR local oscillator.
Since submariners are a paranoid lot (their only real defense is the ability
to hide), the commander for the Nazi sub fleet immediately had use of the
RWRs halted. Since the super-hi-tech solution appealed to the Germans, they
believed the local oscillators were at fault. (This deception was aided by
a patrol aircraft crewmember who was captured by the Germans.)

Don't know if this story is more or less accurate than yours, but it is
a different twist.

I am looking for plans to do the following:

1) Convert a standard car radio so it can receive transmissions in the 460Mhz range of the radio spectrum, and;

2) Construction plans to build a miniature receiver capable of receiving transmissions in the smae range of the radio spectrum. I understand for this I may need to use crystals, and that's okay.

Any help or pointers on where I can find such information would be greatly apprecaited.

Thanks.

Another super trick to get AM from an FM chip is to use an IF amp
(MC1350 or equiv) whose input is connected before the limiter and
SUM the output at the discrimiter input (remove the disc coil).

Voila! Synchronous AM Detection!!

Works with many FM chips...

Hello All -

A few weeks ago I was looking for 455khz xtals for a project; turned out I really needed 455khz resonators. Anyway, the project I was building was a 80m SSB transceiver. The plans were from Derry VE7QK, an active member of the Vancouver British Columbia QRP Club. It is a neat circuit that fits on a board just smaller than a QSL card. It uses NE602s for mixers, has a 455khz IF, and puts out a whopping 1/2watt.

Brad (wb8ygg/2) and I (n2jgu) checked into the QRP net at 3.756 last night with these rigs. It is amazing what 1/2w will do! The article describing this rig is in the September 94 issue of the NorCal QRPp newsletter (that's the journal of the Northern California QRP Club).

If you've been waiting for a voice rig to build, this is a fairly simple one to get on the air. It would not be a good project for a novice builder to attempt. Cost is about $50.

73 for now.
- Gary N2JGU

p.s. To subscribe to the QRPp, send $5 to Jim Cates (wa6ger), 3241 Eastwood Rd., Sacremento CA 95821. BTW, it's a 1/4'ly pub.
[I'm not paid for this info, I'm just a happy, informed QRPer!]

I'm a current user of Vamp's McCAD series. Their software works pretty well under System 7.1, and will even run on a 1M Mac Plus.

Alan's advise to buyers of engineering software applies to software for ANY platform. In the workstation world it is common for developers to demand

funding from hardware makers to port and support that platform. I'm not sorry that Apple is not paying cash bribes to engineering software developers but I too would like to see a better selection of engineering software for the Macintosh.

I'll really miss ClarisCAD. It was/is a great program. Similar enough to

MacDraw to be really easy to use, yet with the proper enhancements to produce the accuracy needed of a CAD drawing program. Its a shame it voilated Ashlar's patents. Ashlar Vellum is a better CAD program, but not as easy to get started with as ClarisCAD.

Some say the engineering Mac software market is too small, well, I've done my part by purchasing $14,000 of Mac software for engineering use in the last several years.

The MC68882 is either built-in or optional on all 68020 and 68030 Macintoshs. Moto data sheets will prove that its faster than the 80387, Intel datasheets will prove the opposite. One slick feature of the 68882 is that 68k CPU's support up to 16 '882's at once. Pretty usefull for parallel processing, or multiple users (OS wouldn't have to swap FPU registers on context switch).

As with the 486, the 68040 in Macintosh Quadras, contains a built-in FPU. Some will gripe that some hardware functions of the '882 are performed in software on the '040, yet the '040 is still 5 or 10 times faster. Watch out for 68EC040's or 68LC040's, one or both of these do not include FPU and/or MMU. I think the Quadra 605 uses one.

The AV series of Macintoshs include on-board DSP and real time video. The AV PowerMac's don't include DSP as Apple claims the PowerPC chip is faster than the DSP was.

How complicated a circuit board do you need to design? For a typical ham-radio homebrew design, you may be able to get by with something as simple as MacDraw. For a multi-layer several-dozen digital IC design, then you'll want something a bit more powerful :-). (For which I see that others have posted recommendations.)

No, unfortunately you cannot slow down the Motorola floating point unit that
much. :-)

Some Macs, even many Macs, have either 68882 FPU chips ('030, or 'LC040,
based Macs) or integral FPU engines (full '040 or PPC Macs); when a 68K
family CPU is being run at a speed that gives it equivalent performance
to a selected Intel processor, the floating point speed is generally well
in excess of the Intel processor, chiefly because Intel just hasn't focused
very hard on FPU speed (since it doesn't help speed up important benchmarks
like DOOM ;-).

There are a couple of system-level issues; many Mac applications do not use
the floating point unit because the Mac _architecture_ doesn't guarantee the
presence of one (much like the Intel 486SX offering). Some of these
applications include inline code to perform floating point arithmetic with
integer operations, and (needless to say) these applications are slow.
Other applications use Apple's "SANE" calls, which trap into the Toolbox
and either use built-in integer code or the FPU if it is present); these
applications are reasonably fast, but that's a lot of overhead compared
with raw FPU instructions. Some applications use raw FPU instructions,
and benefit most from an FPU (these apps are usually shipped both with
FPU versions and non-FPU versions).

>I've always used ibm clones for eng. work - I currently have a 486dx2/66

>software, etc. This involves much manipulation of large arrays containing
>double-precision floating-point numbers, and hence takes time. More RAM
>will be added (up to 32 MB) as money allows. :)

PowerPC Macs are reasonably cheap (cheaper than some Pentium systems), they
are engineered to take good advantage of the PPC processor (unlike the
cheap Pentium systems that are a Pentium chip starving on a 486/33
motherboard), you can be DARNED sure the system will work when you get it
home, and the PowerPC excels at floating point work. (You'll probably need
to buy a developer's kit, though, to port the antenna modelling software.
But, hey, NEC2 sources are cheap.)

2560. Stainless Steel Hardware 18-8 vs 316

: > 73
: >
: > Ed N3SDO
: > Ed@fore.com
: Ed,
: I recently built the Ramsey 2m PA-1 and relay. The amp seems to work
: fine. I run mine from my car (direct to battery) and use my HT to drive it.
: My HT puts out about 0.5 watts on low power, and this gets amplified to 10
: watts at the output of the amp. The relay circuit is kind of touchy with
: this low of drive - they spec a low drive mod, but I didn't do it. On
: high power my HT puts out about 5 watts that is amplified to close to 40
: watts. I don't have lab spec readings on the power out - just my cheap
: RS 2/440 SWR/POWER meter.

: My biggest complaint - there is no provision for mounting the &*^%*&
: circuit board!! I suppose this is to allow "a wide variety of mounting
: options" but I see it as a pain!

: Just my $ 0.05 (that's $ 0.02 + $ 0.03 for taxes).

: Patrick KB8PYM
: pouelle@uoft02.utoledo.edu

I opted to buy the completed unit. I added up the prices of the amp kit, the relay kit, heat sink, and additional assorted hardware and came up with a cost just short of the finished and tested unit.

BTW, if you buy the complete unit, you will find that Ramsey does not use a relay at all! There is a 1/4 (?) wave piece of coax feeding the received signal back around the amp. At the opposite end of the coax from the power amp output is a PIN diode which conducts when the amp outputs. This shorts the end of the coax, presenting an apparent open circuit at the amp end of the coax. Instant switching, works fine on packet.

The only downside to this amp is due to it's being a single transitor output. It is therefore biased ON in the middle of it's range, (let's see, is that called CLASS A ?). The result is that the amp draws 4+ amps at all times. For this reason I don't use it mobile. I occasionally forget and

leave my mobile amp on, I use one which only draws significant current
when I talk, thus not running the darn battery down.

Actually this was a clever British hoax (so I read, don't where now
but I can look that up)
The British spread the rumor that they could locate German subs by
detection of the receiver oscillator radiation. Apparently this worked
quite well: the Germans investigated this and found that their receivers
did radiate. They then took measures to have all receivers modified.
Net effect was that the Germans waisted a lot of resources for nothing...

Another fine story (but this is getting a bit far away from homebrewing)
was that German subs could detect allied aircraft radar signals with a simple
dipole. The trick was to decrease radar energy as soon as a sub was detected
and to decrease it further as the aircraft approaced the sub. This made
(for a while) the Germans think that the aircraft did not approach the sub
but kept a large distance.

Hi everybody

My coax relays are 26 volts models. A long time ago, I saw a circuit able to trigger such relays from a 12 volt source. The only thing I remember is that it was a kind of voltage doubler who supply the relay with 2x12 volt during a short time, and then supply it with 12v.

Does anybody knows this circuit ?

Thanks a lot

From: jfw@ksr.com
Message-ID: <34kkv0$fk9@hopscotch.ksr.com>
Source record: 116409

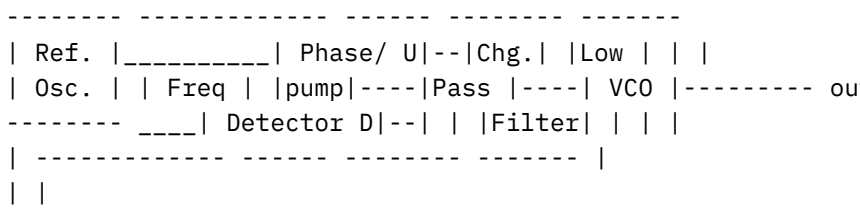
dennis.mcguire@scpcug.com (Dennis Mcguire) writes:
> Can anyone tell me, in relatively simple terms, how a Phase Locked Loop
>circuit works?

A PLL contains four basic building blocks: a reference oscillator, a voltage-controlled oscillator, a phase detector, and a lowpass filter. The goal of a PLL is to make the VCO oscillate at the same frequency as, and in phase with, the reference oscillator. (Note that the reference oscillator is often not part of the PLL circuitry per se; for example, digital data clock recovery schemes, or "automatic frequency control" in your FM or TV receiver.)

There are several types of phase detector; I will describe how a PLL works when using a "phase-frequency detector", the easiest kind to design around but the hardest to understand the internals of (which isn't what you've asked for). A typical phase-frequency detector has two digital outputs, called U and D (for Up and Down), which are both high when everything is stable. If the PFD detects that the reference is at a higher frequency than the VCO, it will pulse the U output low every now and then (the exact pattern depending on the exact correlation between the two input signals); if it detects that the reference frequency is lower than the VCO, it pulses the D output. Additionally, if the two frequencies are the same, but the reference is leading the VCO in phase (turns on first, turns off first, but at the same rate as the VCO), the PFD also pulses the U output low, and if the VCO leads, it pulses D low.

So, we now feed these two outputs into a circuit called a charge pump, which basically adds charge to, or subtracts charge from, a capacitor, according to the control signals; we now have a voltage that increases when U is low, decreases when D is low, and remains constant when both are high.

We pass this voltage through a low-pass filter (to remove the changes that happen at roughly the rate of the oscillator signals) to obtain a smooth "error voltage". This voltage is then fed to the Voltage-Controlled Oscillator to control its frequency (we might need a DC amplifier, depending on the range of output voltages the PFD/charge-pump gives us, and the necessary input range for the VCO).



```
|_____________________________________________________|
```

(Note that the Charge Pump is usually integrated either with the phase detector or with the low-pass filter, depending on the ICs you're using, and that other types of phase detectors don't use a charge pump as such. That's why you see five boxes there when I promised that there were only four major building blocks. :-)

To review how it all works together: assume that the reference and VCO are on different frequencies. The phase detector and lowpass filter causes the control voltage to increase or decrease, as appropriate, to bring the VCO to the right frequency. Once the frequency is right, if the VCO is lagging in phase the voltage is nudged a bit higher to speed it up and bring it into phase lock (note that the voltage will subsquently be nudged lower to fix the frequency!), and vice versa for leading phase. Once the VCO is locked in, it may drift a bit in phase, but will be nudged back by the feedback loop.

So there you have a basic PLL, a voltage-controlled oscillator that follows exactly the frequency and phase of another oscillator.

Why would you want to do that, when you already HAD an oscillator? As I said, one common type of use of PLLs is when the reference oscillator isn't part of the actual circuit; you can use a PLL to track the frequency of an oscillator that is somewhere else, and (especially important) is noisy or has been heavily modulated: you can turn an FM radio signal into a local pure copy of the original carrier by ensuring that the PLL low-pass filter removes all traces of audio signals; thus, the VCO won't keep up with the frequency changes inherent in FM, and instead follows the center frequency of the signal.

Another use of PLLs is in frequency synthesizers: you can make a stable high-frequency oscillator (or, more importantly, stabilize an unstable high- frequency oscillator) by starting with a stable low-frequency oscillator at some sub-multiple of the desired operating frequency (a tenth, a hundredth, or (say) one part in four thousand six hundred twenty three), and inserting a divider between the VCO and the phase detector to divide the VCO frequency down to the range of the reference. If the divider is programmable, you can change the output frequency by changing the division ratio (say, from 4623 to 4624); this is how channelized frequency synthesizers usually work.

Another form of frequency synthesis can give you a continuously variable output frequency: instead of a fixed very-low frequency oscillator, you make a variable frequency oscillator at some easy-to-stabilize frequency (perhaps 3.0 - 4.0 MHz), and instead of a frequency divider, you put a frequency mixer between the VCO and the phase detector; the second input to the frequency mixer would be a high-stability crystal oscillator operating roughly 3MHz away from the desired output frequency. If the crystal oscillator runs at 150MHz and the VFO is at 3 MHz, the VCO could be at either 153 or 147MHz;

tuning the VFO to 4MHz would then lock the VCO at either 154 or 146MHz. You could use a direct mixing scheme to obtain this result (feed the VFO and 150MHz XO into a mixer), but filtering out a 146MHz signal while leaving a 154MHz signal intact (or vice versa) is somewhat difficult (since the percentage difference isn't very high); on the other hand, you can design a VCO that will reach from 146 to 147MHz but *cannot* tune as high as 153MHz, which means the VCO will lock onto the correct frequency and there is no spur to reject.

You can also make frequency synthesizers that combine the two tricks above in almost arbitrary combinations.

FWIW, I believe 316 SS is very nearly nonmagnetic, but 18-8 is magnetic.

The designation 18-8 specified only the chromium/nickel content and is,
by todays standards old and outdated. The modern 316 is also 18-8 with
a more detailed specification of the minor elements. There is also a
316L which is made to be more suited to welding. So, for non-critical
applications (antenna hardware) they are the same.

Hello, I am doing a telemetry project and I am curious if this will work.

We want to transmit a audio fsk digital signal to the ground. Now, on the ground can we just buy a regular 70 cm band receiver and will it spit the same digital audio tone out of the back, and then from there is it possible to use some sort of tone decoder or modem/tnc to then change the tones into a digital output which can then be feed into a computer I/O device.

I am looking for some information about if this design will work, and if so what are some specific products that we can buy and where can I get them.

Any Help Please.
Thanks, Bill

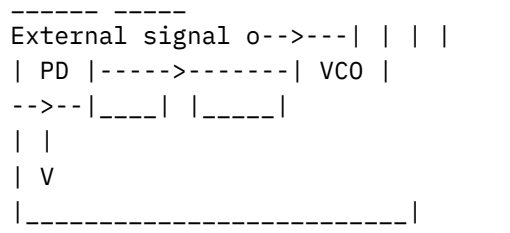
: Can anyone tell me, in relatively simple terms, how a Phase Locked Loop
: circuit works?
: --- FreeMail 1.09
: * Origin: Tim's BBS * Erie, PA * 814-825-1731 * (1:2601/566)

A PLL reminds me of an op amp with negative feedback, but with
frequency (or more accurately phase) being the amplified, fed back
quantity, instead of voltage.

A PLL has at least two sections: a phase detector (PD) and a voltage
controlled oscillator (VCO). A phase detector has two inputs and one
output. The output of the PD is a voltage proportional to the phase
difference of the two inputs. The output of the PD goes to the input
of the VCO, controlling the VCO's frequency.

The output of the VCO is then fed back to one of the two inputs of the
PD, providing negative feedback.

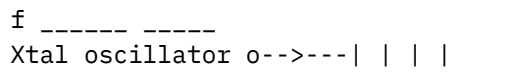


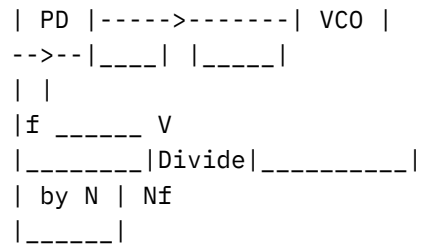
The PD adjusts its output, and therefore the frequency of the VCO,
to maintain a zero phase difference between its two inputs. Therefore,
the VCO output is at exactly the same frequency as the external input.

Applications:

1. FM detector. If the external signal is FM, the VCO output will be
an exact replica, and therefore the same FM signal. What input to the
VCO would make it give such an FM signal? The desired audio signal
that was used to generate the original FM signal! So if you tap off
the signal between the PD and the VCO, that is the audio signal that
was encoded on the external FM signal.

2. Frequency synthesizer. The external input signal is now the
output of a quartz crystal oscillator, and a divide-by-n circuit is
put between the VCO output and the PD:





```
-------| VCO |
-->--|____| |_____|
| |
|f ______ V
|________|Divide|__________|
| by N | Nf
|______|
```

Once again the PD adjusts the VCO so that the PD's bottom input matches the top input in phase and frequency. Since the bottom input is coming out of the divide-by-N, the input to the divide-by-N (the VCO output) must be at N times higher frequency. By varying N, you very the VCO frequency in increments of f, the xtal oscillator frequency.

Thus you have an digitally adjustable frequency source as accurate and stable as the quartz xtal oscillator.

#AL N1AL replies:
#To do a paper design, you need to know the parameters of the crystals,
#namely the series-resonant frequency, motional inductance or capacitance,
#shunt capacitance and (possible) motional resistance. The design is
#not trivial.

#An easier method is trial and error. Start with a signal crystal:

--+---crystal---trimmer_capacitor---+---
| |
trimmer trimmer
capacitor cpacitor
| |
ground ground

#Tune the series cap for the desired center frequency and the shunt
#capacitors for a little wider than the desired bandwidth (and
#minimum insertion loss.) Now build another identical section.
#Then connect the two sections in series. (You only need
#one shunt trimmer capacitor, not two, where the two sections meet.)
#adjust the center section for proper coupling. If the cap is
#too small, you are over-coupled which gives a double-hump response.
#If the cap is too large, you are under-coupled which causes
#excessive insertion loss.

#Then build another two-section filter and add it in series with
#the other to get a 4-crystal filter. Again adjust the common
#shunt cap for proper coupleing. I have found that 4 crystals
#give a reassonable shape factor and excellent ultimate rejection
#if proper shielding and grounding techniques are used.
#
#Of course, you need some kind of sweep oscillator to make this
#method practical. Perhaps you can borrow someone's Heathkit
#Scanalyzer if real test equipment is not available.
#
#AL N1AL

I also need to build xtal filters for a NE-602 project and this method
looks attractive. Need following filters:

10.7 mhz 55 khz bandwidth
10.7 mhz 15 khz bandwidth

Can I use cheap Microprocessor xtals for this 10.7 mhz task?

Can I make a xtal filter "as wide as" 55khz or 15khz with this technique?

How can I determine input and output impedance requirements
for the xtal filters produced by this method?

A second related question about 10.7 mhz filters.

The circuit application is a NE-602 used as a mixer driving a chain of
ceramic filts into a CA-3089 FM IF driving an LM380 audio amp.

My question concerns the ceramic filter(s) feeding the CA-3089.

1st ckt uses two 10.7mhz 230khz ceramic filters between NE-602 and CA-3089.
2nd similar ckt uses three 10.7 mhz 230 khz filters.

How is bandwidth performance different with 3 identical bandwidth ceramic
10.7 mhz filters in series versus having 2 in series? Does it impact
insertion loss? All filters seem matched at 330 ohms in and out.

Thanks for any help

Mike-

As someone else pointed out, the answer to this question may depend on who you ask! Certainly FPUs can be added to many Macs that don't have them.

The issue, as I see it, is that many software companies won't write engineering software for Macs, regardless of how good they are. I think that if Macs were 49% of the market, with MS-DOS/Windows at 51%, nothing would change. Companies concentrate their efforts to maximize profit, as if they were responding to a simple, single-minded computer program. "Better" doesn't count. "More" counts.

Dennis Mcguire <dennis.mcguire@scpcug.com> wrote:
> Can anyone tell me, in relatively simple terms, how a Phase Locked Loop
> circuit works?

The idea is to compare two signals to each other, using the output of the comparison to alter one of the signals. The effect is to narrow the phase difference between the two until they are "locked" to each other.

A simple but useful loop looks like this:

```
Dirty signal ------ Phase Comp ------ LPF ------ VCO ---+------
| |
+------------------------------+
```

The phase comparator compares the two signals and outputs an indication of the phase difference between them. The Low Pass Filter passes just the DC and near-DC components of the comparator's output to the VCO. The result is that after some settling time, the loop exactly matches the VCO frequency and phase to the input signal. This kind of loop might be used to filter DDS output or some other harmonic-laden signal.

If you tapped the output of the LPF, you'd find that this loop makes a good FSK or FM demodulator. The LPF control of the VCO is much like the microphone controlling a VCO in the transmitter, so in effect you're locking the receiver's VCO to the transmitter's and recreating the voice or data signal necessary to keep the lock.

To see a different application, add a divider to the loop, like this:

```
Input signal ------ Phase Comp ------ LPF ------ VCO ---+------
| |
+------------ Divide -----------+
```

This gives you a wonderful thing -- an arbitrary frequency multiplier! Suppose the input signal is a 100 KHz crystal-controlled oscillator and the divider divides by 16. That means the phase comparator sees two 100 KHz locked signals only if the VCO is running at 1.6 MHz. Make the divider programmable and you can generate any multiple of 100 KHz reachable by the VCO.

To see what makes this really useful, suppose the input signal was 100 Hz, and make the divider divide by 71100. Then you'd have the VCO running at a nice 7.110 MHz, smack in the middle of the 40m novice band. Make the division ratio change under the control of a knob, and you have a "synthesized" VFO for a 40m rig!

These are simplistic PLLs. There are many variations for better performance or special functions. A PLL can be built to lock onto a harmonic of its input signal, or it can do frequency translation sort of like a mixer but without an extra sideband. Several PLLs can be nested to get extra tuning resolution or greater stability. PLLs can do lots of varieties of demodulation and some kinds of modulation.

IMHO, a lot of magic is in the phase comparator. A phase comparator may be as simple as a double-balanced mixer or an XOR gate, but many are more complicated. A typical design might have several flip-flops controlling three or more states on the output.

Weak points of PLLs: They always have some phase noise. They take time to settle to a new frequency. Many are limited to one octave or less in tuning. There's a tradeoff between speed of tuning and tuning resolution, partially solved by more complex dual-modulus dividers. The dividers need to be fast (ECL is sometimes needed) and introduce digital noise into what might be otherwise a quiet analog system. Finally, PLL analysis is well understood but notoriously heavy on math.

If you just need a 100MHz pulse rate, you can use any of the
74Fxx or 74ALSxx series chips. They should have no problem
running at 100MHz. All you would need is the 100 MHz
crystal. You can use the 74ALS00 (quad nand gate) chip
and the 100MHz crystal as an oscillator.

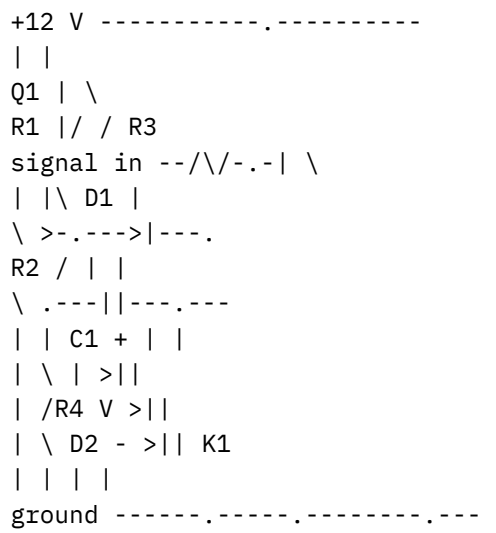
I remember seeing that too. I don't remember the exact circuit, but here is my best guess.



C1 charges through R3 and and R4 when Q1 is off. When Q1 is switched on, it applies 12V to the low side of C1. The voltage on C1 adds to this 12V and you get 24V across the relay. D1 allows 12 (well, 12 - 0.6) volts to be applied to K1 after C1 has discharged. D2 shunts any inductive kickback back into the coil. If K1 must open rapidly, you might want to substitute an RC snubber circuit.

I have not tried this circuit, but it looks likely. Does anyone remember the original circuit? Is it simpler than this?

The trick is to use both your 12v supply plus 12v from a capacitor to
push the relay over and then hope that 12v is sufficient to hold it
over. No guarantee that only 12v will apply enough contact pressure!

You will need a 12v DPDT relay and a 330-470 mFd @ 25 volt capacitor. Also
put rectifier diodes across both your 26v and the added 12v relays to kill the
spikes plus one more to feed the capacitor.

I would guess that you can figure it out. Regret I can't draw a schematic
on a keyboard.

By the way you can get a very neat complete kit of parts and PC board from
Down East Microwave in Maine, tel 207-948-3741 fax 207-948-5157. Costs $10
for their model DEM RVD-1.

2592. AG6K and this month's Tech Correspondence in QST

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-08 19:37:18 UTC
From: rdewan@uhura.cc.rochester.edu
Message-ID: <1994Sep8.193718.14078@galileo.cc.rochester.edu>
Source record: 116282

I was leafing through this month's QST magazine. The technical
correspondence column made some very interesting reading.

I had previously read the articles on VHF/UHF parasitics in HF amps,
design of HF amps, design of balanced tuner and so on by Rich Measures in QST.
His articles on these topics have also appeared in the now defunct Ham Radio
Magazine. This month's Tech Correspondence column is devoted to a critical
examination of Rich's theories. It has comments by an engineer from
Eimac, an engineer who designs amps for ameritron and others. To put
it mildly, it disagrees with Rich Measures.

What did you think?

On many points, it is clear that the critics are right. For instance,
consider the anode parasitic supressor. The common form of it is a
resistor with a coil wound around it. One of Rich's ideas is
to make the coil out of nichrome wire (has some resistance) to
prevent V/UHF parasitics. He sells this in kit form. But as the critics
point out, At VHF/UHF the coil has high impedance and it is the resistor
that is a part of the anode circuit, lowering its Q at those frequencies.

The critics also disagreed about removing electronic drive control, alc,
using improper protection in the HV section, using resistor in grid-ground
circuit to introduce negative feedback to reduce gain and most seriously,
about using MOVs in the HV circuit.

While I tend to agree with the critics generally, several of them
said that UHF/VHF parasitics are not a problem in most commercial
amateur amps. My tiny experience in these things seems to be otherwise.
I have seen amps with some of the symptoms that Rich Measures described.

What has your experience been?

Another curious point: If the article was so off the mark, what does
it say about QST's editorial process. It is bad that it hapened
but good that they own up to it? or what? In QST's defense,
even the best of scientific journals have this problem.

Honey, where is the salt shaker? I received this month's QST. :)

I have heard that there is a better transistor that can/could be used in the same design, swr protection, better thermal stablity... anybody know which one that is?

>You didn't happen to record the PIN diode's part number did you? I'm
>interested in eliminating the relay and going to a PIN diode switch.

Humm, diode switching instead of relays... Yeah, sounds nifty, add me to the list of people desiring this mod.

Okay, now that the 1/2-of-100 MHz-equals-50 MHz people have had their fun, here is an actual source:

Q-Tech Corporation
10150 West Jefferson Boulevard
Culver City, CA 90232-3502
phone (310) 836-7900
fax (310) 836-2157

They sell up to 100 MHz TTL clocks in DIP cans and flat packs.

Such a thing DOES exist. So there.

Low power (relay about 1/2" high) versions of these were door prizes
at the Eastern States VHF conf in CT a few weeks ago. Presumably some
company who was sponsoring the event made or supplied them. I don't
know who they were. However Ron Klimas (WV1Z or something like that)
who was an organiser of the conference might remember.
klimas@uhavax.dnet@ipgate.hartford.edu.

I've made doublers out of a 555 chip as square wave osc, followed
by a pair of pushpull power transistors (don't need heat sink as they
don't disapate much power) followed by a diode voltage doubler.

BZZZT! WRONG!

I was at home mowing my grass when I realized that there was a problem with this idea. A big one.

Due to K1, C1 won't be able to charge up to 12V when K1 is not energized. The only quick solution I can think of adds three more parts. I already felt the circuit was too complex, I know the original was simple and elegant.

I'll think about the problem some more...

SETIQuest is a new quarterly print/electronic mail (E-mail)
periodical containing news, technical information, and tutorials
devoted to bioastronomy and its subset, SETI (Search for
Extraterrestrial Intelligence).

SETIQuest is published for professionals, serious amateur
astronomers, and individuals curious about this fascinating field of
observation. SETIQuest fills the need for a specialized astronomical
publication devoted exclusively to the on-going search for evidence
of life in the Universe. Such evidence could be intentional or
inadvertent signals of other civilizations. Such evidence could be
found in spectral signatures of biological activity on extrasolar
planets or in the interstellar medium.

SETIQuest is written and edited for the scientifically literate
individual taking part in the progress of our technological
civilization, with articles by amateur and professional scientists.
SETIQuest includes information about hands-on observational programs
that can be carried out by individuals and groups of amateur
astronomers at radio and optical wavelengths.

SETIQuest is filled with articles covering topics such as:

* Tutorials about bioastronomy and SETI
* Microwave or optical SETI as practiced by amateurs
* "Do-it-yourself" participation in bioastronomy and SETI activities
* Book reviews
* Regular commentary on issues relevant to SETI and bioastronomy:

SETI and the political milieu

Philosophical issues regarding the prospects of success and
failure in the search

SETI as a parable of science versus pseudo science

Publications Watch: Summaries of recent scientific/general
publications relevant to SETI

For your FREE issue of SETIQuest (Volume 1, Number 1), send us

A while back I asked about putting 4 distinct voices on a carrier using
both sidebands and both quadrature phases. I was told that it's not possible
to use both techniques at the same time. I wonder what you'd get, then , if
you suppressed one sideband of a QAM signal. (?)
Also, I've noticed that the sidebands of an FM signal seem to contain
harmonics of the tone being carried. I wonder if there is some way of
processing audio (such as distorting it) that will cause an AM transmitter to
transmit FM. I want to know if I can transmit FM with a non-variabkle
oscillator producing the carrier. (?) Is this possible?

2602. xtal vs ceramic resonator. accuracy?

Source record: 116293
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc

A friend of mine (without internet access) has a ICOM 22s that has
been mod'ed so that all the repeater pairs btwn 146 - 148 on the
front panel instead of the '1', '2', '3', etc. where the diode matrix
determined the Tx and Rx freq.s and included simplex. The
problem is, now that the mod had been made, the simplex freq.s are
no longer avail., but a four row diode matrix is avail.

He has heard of a way of adding back in the simplex freq.s using this
diode matrix. He wants to use the rig for packet, and free up another
rig.

Anyone familar with is mod to the 22s and a way to add back in simplex ?

2604. Mitrek 800 Mhz Service Manual/ Info ??

From: davies@mobira.nmp.nokia.com
Message-ID: <34p7a2$aub@noknic.nokia.com>
Source record: 116295

I have recently got hold of a broken Amplifer Research (AR) model 40L broadband amp. I think it is spec'd at 1 to 250MHz, 40W minimum ouput. Gain maybe 45 to 50dB. It blows its EHT fuse.

Inside it uses 8 off RCA 8121 valves - does anyone know what these are spec'd at? I'm under the impression they are run conservatively, and I might be able to up the output power by 3dB or more, assuming I was able to fix the amp. The valve amp is preceded by a few stages of solid state, which I think are OK.

Does anyone have a schematic for such an amplifier? I'd be delighted to refund cost of photocopying and FAX/postage costs. Or any basic info, like valve voltages likely to be used? Has anyone every played or fixed one of these type amps?

Thanks for any help.

Try calling Motorola National Parts at (800) 422-4210 for manual. A radio
as recent as the Mitrek should be no problem for a manual.

It isn't worth the trouble. A&A parts is always at the TRW swap meet selling
30KHz and 15KHz xtal filters for maybe $7/ea. You can probably do better
if you go to a distributor, but there's likely to be a minimum order.

The 55KHz wide filter may be a problem, but I bought a couple of 15KHz
filters from A&A last year.

> What are people using for power amplification on EME? I'm looking at 2m or
> 432, and trying to keep the costs down somewhat. How much power are you using,
> and what is your amp... homebuilt, surplus, used....?

If you are going to use a reasonably sized antenna system, then a very economical amp would be a pair of 4CX250s. These tubes are very common on the surplus market, and usually at reasonable prices ($25-40, maybe less). The sockets for these tubes are also fairly inexpensive. There have been numerous articles written on amps for both 2m & 432 that use a pair of these tubes. 10 watts of drive should get you about 600 - 800 watts output. The disadvantage of using tetrodes is the fact that you have to provide an additional power supply for the screen.

I have been running 2m EME for about a year. I'm running a pair of 4CX300A's which deleivers about 800 watts output. It is a hamebrew amp that I bought at a hamfest. These tubes work fine on 2m, but they are a lot harder to find than the '250s, and generally the sockets are more expensive (the tubes have a bayonet style base rather than pins, so they require special sockets).

My antenna system is 4 x 10 element yagis (K5GL design). It's actually a fairly small system for EME, but it works reasonably well. I have made 11 QSOs with it, including several other 4 yagi stations, plus I've heard quite a few stations that I didn't complete QSOs with. I have, at times, been able to hear my own echos with it as well.

Can anyone help me with documentation for H.P. Model 3431A Digital Panel meters? I have acquired two of them that I want to use in my 4-1000A Amplifier Project but I don't have pinout numbers or any other info. They are AC operated and look to be 3 1/2 digits. Anyone help on this one?

Ken-

If that is the same mod as I have, each switch postion is actually for the lower frequency of the repeater pair. When the left-hand toggle switch is in one postion, the radio transmits and receives on the same frequency. When in the other position, it transmits and receives 600 KHz apart. The right-hand toggle switch determines whether the transmit frequency is offset plus 600, or the receive frequency is offset plus 600.

Included among those repeater frequencies, are the simplex frequencies as well. As I recall, the switch has MANY postions, and covers from 146.01 to 147.57, in 30 KHz steps. There was an ultra-miniature toggle switch that could be added, that would change the main switch range by 15 KHz, so that all channels could be accessed. A second ultra-miniature toggle switch could be added to make BOTH transmit and receive frequencies be offset plus 600 from the switch setting.

As you suggested, I believe there were one or two "blank" switch postions that might be used for diode-programmed frequencies.

Kevin-

A 100 MHz crystal is most likely used in a fifth or seventh overtone mode. How do you ensure that the crystal oscillates at the correct overtone, instead of the fundamental or an "easier" overtone?

Good point. I assume you're running a multivibrator with the crystal in one feedback arm. How about putting an L - section filter (presumably L from output back to input and C across input to ground) and tweek the C till it runs in the right overtone?

I did something like this with an RC coupled TTL multivibrator that I wanted to put a 10MHz xtal into. I got it running about 10MHz without the xtal by changing the R&C, and then put the xtal in between the input and the RC junction.

Hello,
I am still very new to amateur radio, but I really like to build
circuits. Does anyone have a schematic for a home-built SWR meter
for 2M? I haven't had any success finding one in any of the ARRL
publications I've been able to find.
Thanks in advance.

:
: #AL N1AL replies:
: #To do a paper design, ... (etc.)

: I also need to build xtal filters for a NE-602 project and this method
: looks attractive. Need following filters:
: 10.7 mhz 55 khz bandwidth
: 10.7 mhz 15 khz bandwidth
:
: Can I use cheap Microprocessor xtals for this 10.7 mhz task?

You can use microprocessor crystals if a somewhat poorer-performance filter is acceptible. Cheap oscillator crystals will likely have worse spurious responses (generally within a few 10's of kHz of the center frequency.) They also may have higher series equivalent resistance, which will increase filter insertion loss. You can solve the spur problem by using more poles (crystals) in the filter, but that will increase insertion loss even more. One solution is to break the filter into two parts (say a pair of 2-pole filters instead of one 4-pole) and insert a low-gain amplifier between them to make up the loss.

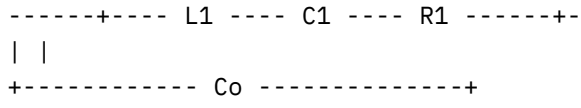
: Can I make a xtal filter "as wide as" 55khz or 15khz with this technique?

It depends on the crystal circuit parameters. Generally, the smaller the shunt (holder) capacitance, the wider the filter you can make. My gut feel is that 55 kHz would be quite difficult to achieve at 10.7 MHz.

: How can I determine input and output impedance requirements
: for the xtal filters produced by this method?

It depends on crystal parameters and the value of the shunt capacitors used in the filter. I have found that for narrowband (CW) filters, you can use nearly any crystal with nearly any desired in/out resistance by proper selection of the shunt capacitors. (Bigger capacitors for lower impedances.) For wideband filters, a too-low load impedance will make it impossible to get a wide enough bandwidth with any value shunt capacitors.

Let's run through a simple example. Standard model of quartz crystal:



Let L1 = .02 H, C1 = .01 pF, R1 = 30 ohms, and Co = 5 pF.
Series resonant frequency is thus 1 / (2 PI SQRT (L1 C1)) = 11.25 MHz
and unloaded Q is (2 PI f L1 / R1) = 47,140. With a 270-ohm load,
the widest bandwidth you could obtain would be 2387 Hz, with the shunt
capacitors = 0 pF (removed). To get 55 kHz, you would theoretically
have to go to at least a 6,880 ohm load impedance. In reality, however,
you would not achieve that, since the parallel resonance (L1, C1 and Co)
is only 11.2 kHz higher in frequency than the series resonance (L1/C1).
Wide bandwidth requires a crystal with small shunt capacitance (Co)
and/or low-impedance motional parameters (small L1 and large C1).

Unfortunately, these parameters are never specified for cheap oscillator
crystals, so you have to just build the filter and tweak for best
performance.

: A second related question about 10.7 mhz [ceramic] filters. ...
:
: How is bandwidth performance different with 3 identical bandwidth ceramic
: 10.7 mhz filters in series versus having 2 in series? Does it impact
: insertion loss? All filters seem matched at 330 ohms in and out.

I'm not very familiar with ceramic filters, but I expect that using
3 in tandem (rather than 2) would result is higher insertion loss and
slightly narrower bandwidth. The skirt selectivity and ultimate
rejection would be much better.

: ... One of Rich's ideas is
: to make the coil out of nichrome wire (has some resistance) to
: prevent V/UHF parasitics. He sells this in kit form. But as the critics
: point out, At VHF/UHF the coil has high impedance and it is the resistor
: that is a part of the anode circuit, lowering its Q at those frequencies.

Measures has been flogging his "low-Q" parasitic choke idea for years.
As pointed out by others, he is totally wrong. VHF parasitics in HF
amplifiers are caused by high-Q parasitic resonances (at the VHF frequencies)
in the plate tank circuit and related components. High-Q resonances tend
to result in feedback, which makes the "amplifier" act like an oscillator.

: The critics also disagreed about removing electronic drive control, alc,
: using improper protection in the HV section, using resistor in grid-ground
: circuit to introduce negative feedback to reduce gain and most seriously,
: about using MOVs in the HV circuit.

I agreed with all the critics' comments except for one item (see below).

: While I tend to agree with the critics generally, several of them
: said that UHF/VHF parasitics are not a problem in most commercial
: amateur amps. My tiny experience in these things seems to be otherwise.
: I have seen amps with some of the symptoms that Rich Measures described.

VHF parasitics are definitely a potential problem. The question is the
best way to fight them. The first line of attack is careful physical
layout of the tank circuitry to reduce stray inductance to a minimum.
That moves the parasitics higher in frequency, where they are easier to
suppress. It is also important to isolate the amplifier input and output:
That kind of feedback can be impossible to suppress, even with the best
"parasitic suppressor!"

One place where I disagreed with the critics is the use of equalizing
resistors and capacitors on high-voltage rectifier strings. If I get
time, I plan to write a letter to QST discussing the issue.

Not possible without some kind of frequency or phase modulation of the carrier.
You could get the spectrum to look similar on a spectrum analyzer, but the
modulation harmonics would have the wrong phase: the signal would not be FM.

: I want to know if I can transmit FM with a non-variabkle
: oscillator producing the carrier. (?) Is this possible?

Yes, it has been done for many years (at least since before WWII).
The trick is to follow the oscillator with a phase modulator. (WWII
radios used a reactance modulator for that.) To convert the phase
modulation to FM only requires changes to the microphone amplifier
circuit: a 6 dB-per-octave low-pass filter (i.e. an integrator).

I need a 2SC1947, which according to my cross-ref is equivalent to an ECG 341 (or NTE 341). This is a 4-watt rf power transistor that has an oddball lead arrangement and the emitter tied to the case. This makes it very difficult to substitute a more common transistor.

My local electronics dealer tried to order the ECG equivalent, and it has been backordered for a while. Apparently they are out of them and don't know when they plan to make/get more. The dealer wanted $6.50 for the thing. If anyone out there has one they can sell me (or can get one fairly quickly) for a price that isn't too outrageous, I'd love to hear from you.

By the way, I need the transistor to repair a Diawa MT-20 handheld. This is an ancient and rare two meter amateur handheld transceiver. If anyone has any accessories for the MT-20 (particularly a battery pack, working or not) that they'd like to sell, I'm interested.

Thanks,

The real gotcha with trying to do 55 kHz. is that you will probably run into spurious resonances before you get 27.5 kHz. above series resonance. And there is nothing you can do about this, as far as I know. It might help to work at 21.4 MHz. instead.

Actually, if you filter out either the upper or lower sideband of an AM
signal, you will convert some of the AM to FM. Hence slope detection works
for hearing AM on an FM receiver as well as the usual FM on an AM receiver.

Also, if you strip of one sideband of a QAM signal, it will no longer be
possible to separate out the I and Q signals.

Before you ask the question: there is no such thing as single sideband FM.
If you throw away the upper sideband(s) of an FM signal, it will be distorted AM.

>: I want to know if I can transmit FM with a non-variabkle
>: oscillator producing the carrier. (?) Is this possible?

Of course you need to follow the phase modulator with a frequency
multiplier to get "wideband" FM.

And the phase modulation can be done without a variable phase amplifier.
Simply generate a double sideband suppressed carrier AM signal and then
reinject the carrier with a 90 degree phase shift. This is called the
"Armstrong method" historically, I believe.

2621. Freq. Counter Problem

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-10 01:41:00 UTC
From: hirschj@vax2.concordia.ca
Message-ID: <9SEP199420411601@vax2.concordia.ca>
Source record: 116311

I have an older model tube general receiver with analog tuning. To
improve my tuning accuracy I hooked up a frequency counter by taking
a tap from the oscillator plate line using a 1 uf 1 kv capacitor. The
lead was sent to the frequency meter and the ground of the meter was
connected to the ground of the radio. This arrangement works exceptionally
well (7 decimal place accuracy, as long as I remember to subtract
the oscillator's frequency from the meter reading) except on 3.3 to 5.6 MHz,
where I get no reading on the meter. However the oscillator is obviously
working since I tune in stations effectively and the analog frequency
reading appears to correspond to the stations' announced frequencies.

Could anyone hazard a guess as to why the anomaly for 3.3 to 5.6 MHz?

Thanks for any suggestions.

Regards,
Jack

2622. [Q] Suggestions for remote powerdown?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-10 03:01:31 UTC

OK, here's the situation:
I have a 486 running Linux, zyxel modem, etc.
I like to have my machine up all the time for my answering machine software, dialin access, etc.
I'm somewhere else and I know there's a lightning storm heading towards my computer.

What I'd like to be able to do:
Switch off my machine remotely by having the computer cut power to its own power bar via a serial port or some other digital signal from my computer (ie after killing processes and syncing filesystems).

The software side is trivial. Just have my voice/fax software run a script on some command. When the system halts or power goes down, the phone line will automatically go back on hook. And no, my machine is not a sentient lifeform! :-)

Gravy:
It would be nice to be able to specify a time duration after which the system will automatically revive itself. This is not critical and I figure I can work this out myself.

QUESTION(S):
Has someone built such a device?
What sorts of relays/switches could I consider using?
Would the bouncing of (say)relay contacts pose their own problems like spikes to the computer?
Perhaps it's safer(regulation-wise) and simpler to just have a mechanical device with solenoids sit on top of the powerbar's rocker switch? It just doesn't seem elegant.
What about other lightning-safe concerns?

I'm not looking for something that will survive a direct hit on a house with the resultant charge arcing across all the open switches. Just something reasonably cheap, simple, and effective for the usual lightning-induced power fluctutations.

From: Michael@arkas.demon.co.uk
Message-ID: <779248620snz@arkas.demon.co.uk>
Source record: 116317

OK - I'm not hombrewing a key, but I am looking to homebrew a "low parts count" portable transceiver. I wish to use cw, but am not interested in dragging the MK2 8 Amp key around with me on portable ops!

I've seen small keys on military gear ... but not at all in the surplus vendors that I have access to. (I think they get snapped up at a lightning-like rate once they appear in the surplus store!) I know of a good key that is part of the AN-PRC/VRC 47 set kit -it has a clip that allows the operator to sit down and fasten the key to his/her leg. It's slightly heavier than I would want (so's the 47 set!) and a smaller key would be good. The other alternative is a small dual paddle unit -the Bencher paddles are good in shacks but are too heavy and too nice to put in a ruchsack, I think.

Does anyone one know of manufacturers / retailers that sell small, lightweight keys / paddles that would be useful in my desired application?

Replies ok either here (rec.radio.amateur.homebrew) or email to michael@arkas.demon.co.uk

How about a reed relay taped to the inside surface of the top of the cabinet? Then tape a magnet to your finger or put a magnet inside your glove and tap away. Might be just the thing on really small rigs for backpacking, no wires, no connectors, contacts protected from the elements. I haven't tried it yet though.

Might implement a keyer paddle in a similar way with reed switches on two sides of a reasonably thin box, and magnets on thumb and forefinger.

If we really got carried away, could implement things like band switches and power level selection with reed relays also. Put a small piece of steel near these reed relays so any magnet placed over it will stick in place.

The heavy part of the Benchers is the base. You could remove the working
parts, and mount them on a piece of circuit board or something else lightweight
that you could strap to your leg.

From my reading about the SoundBlaster interface, it is not possible to use the DMA interface for simultaneous DAC and ADC. However, it looks like it ought to be possible to use direct programmed I/O to do it. But, maybe it works in theory but ends up sounding lousy.

Perhaps the SB16 is more flexible? Has anyone seen specs for programming the SB16? I've only seen specs for the 8-bit cards.

*****************************************************************
* *
* INTRODUCING 'FAISYN' FILTER SYNTHESIS PROGRAM FOR MSDOS *
* *
*****************************************************************

faisyn20.zip Electronic Filter Synthesis Program

FAISYN is a low cost, effective alternative to expensive commercial
filter synthesis packages. The program has be used to design lumped
element filters and diplexers from 10's of KHz to 1.5GHz and is the
result of many years experience in filter design. Designers know
that filter design is often an iterative process. Tedious number
grinding is sometimes required to optimize a design. FAISYN eases
the burden by allowing the designer to quickly synthesize a variety
of circuits that can be simulated and compared using your favorite
circuit simulator (FAISYN currently supports PSPICE-TM Microsim,
MMICAD-TM Optotek and TOUCHSTONE-TM HP/EESOF circuit formats).

Special Requirements: None

Shareware.

Faisyn was developed by:

Kevin Faison
Carriage House Engineering
16 W. Pleasant Hill Rd.
Owings Mills, MD 21117

You can get FAISYN20.ZIP from one of the following sources:

1. I have uploaded the program to the SIMTEL collection. It is
located there, and on it's mirrors in /pub/msdos/electric. I
usually have good luck with oak.oakland.edu

2. I uploaded it to watson.ee.ualberta.ca, it can be found in the
/pub/cookbook/softw/ibm directory.

A call for documents...

Interact is soliciting for the submission of computer-readable documents of all types for addition to the Interact On-line Information System.

All submitted documents are immediately cataloged by company name, author, title, Dewy Decimal Number (if applicable), and several key words. They become instantly available for down-load to anyone with a modem, 24 hours a day at no charge to the author.

Interact pays a 50% royalty to authors who have their documents down-loaded. The price of the down-load is determined by the author at the time of the document's submission.

The Interact On-line Information System is the only public access server that allows anyone to publish documents free of charge and receive monthly royalty payments.

Interact is dedicated to providing on-line publishing services to all writers, composers, painters, photographers, software developers, and information providers free of charge.

To learn more about how to publish your documents, use your modem to call 1-714-378-4704 (8 N 1).

This is just a message to reveal what I beleive to be an internet scam that has caught many net newbies unaware (including me) and to apologize to the users of news groups where I may have posted.
It is usually under the subject heading MAKE.MONEY.FAST. The message says it is a legal mail list. I don't know if it is legal or not but it is in severe bad taste. It is also a misuse of a government sponsored internet account.
So if any of you see a message of the above description, please let the issuer of it know what is going on. They are probably relatively new to the internet news groups or they would have some clue about what the message is.
If any of you have already added your name to this thing, the best thing to do would be to let others know that it is in poor taste and to apologize to the places that it was posted.
To everybody else, my advise is DONT BE DUPED!

Hi !

I am working on two projects at the time : the first involves the design of a 23 cm phone repeater (6 MHz shift), and the second is the design of a 10 GHz BLU transverter. For both project, I need some data about low-noise FETs, but I lack it.
Does anybody have any idea about what kind of device I should use ? I don't care about price, as long as it does not reach $20 per part.

Thanks and 73 !

I used a j45 (war surplus), a leg clamp with a j38 straight key
mounted on it for a while. It is quite light and a pleasure to use.
Fair Radio Sales of Lima, Ohio has them for $30 a piece.

Lately, I replaced the j38 on the leg clamp with a small aluminum
box abt 1"x1 1/2" x 2 1/2" containing the cmos super keyer ii (see
arrl hand book for a description) and a tiny set of iambic paddles
called the Einbau Wabbler. The paddles are hand made by a master
machinist in Germany and imported into US by Electro Switch of
Atlanta, Georgia. You can also order them from Ham Radio Outlet
in Atlanta. HRO obtains them from Vern (the owner of electroswitch).
In any case, this combination works extremely well for mobile operation.
I have it clamped on my thigh where the hand rests naturally. It
is also close to the gear shift lever!

Well Fred,
I didn't really consider that. You are probably right. I guess one could use an overtone oscillator or harmonic oscillator, amplify the output to a level that TTL would see and then run it through a TTL gate such as 74ALS00 or 74ALS04 for shaping.

Kevin

> Thanks for any suggestions.

> Regards,
> Jack

Since the signal coupled into the freq counter is frequency
dependent You are probably see the practical proof of ac transfer
thru a capacitor! You have less drive for the freq counter as
the frequencie is dropped.

I am after a 250Hz CW filter for an FT101Z, and any improved mixer in the reciever (To fix 40m intermodulation distortion).

Some helpful person has suggested I try International Radio and Computers in Florida, who apparently, sell crystal
filters for many old rigs, but unfortunatly had not 'phone number etc.

I telephoned Amateur Electronics Supply, Good Hope Rd, MilWaulkee, who suggested I try the Foxtrot-Tango Club, Also in Florida, who manufacture filters for old radios.

Does anybody have e-mail, Voice or Fax numbers for either of these

\MILLIWATT REPRINTS ON THE WAY--PROBABLY

Sorry to bother the homebrew newsgroup with this one--this is for the benefit of the many QRPers who recently unsubscribed to the QRP mailing list when it changed hosts and lost the digest capability. I believe many of you are still here on the homebrew newsgroup (and there may also be others who are interested in this).

I'm still not taking orders on my non-profit reprinting (photocopying) of The Milliwatt ("National Journal of QRPp"), but I'm taking another poll, this time to see who is SERIOUSLY interested--my partner is negotiating with the printer, who raised his estimate sharply after Partner showed him the material to be copied. With the higher price the printer is now quoting, it looks like we might have to charge up to $25 in the US/Canada, UPS-paid. (The higher quote is still a bit cheaper than I could have done it at Office Depot.) If you're still interested, let me know; we need to get an idea of how many copies to order, although this won't obligate you in any way--you can change your mind later and back out. (This isn't a small document, either; it includes the entire 33 issues of the Milliwatt, and that comes out to 180 sheets of 8 1/2 X 11 paper, printed on both sides.)

For those who've never heard of it, The Milliwatt was the pioneer QRP journal in the US, running from 1970 to 1975. (The QRP Quarterly in those days was not what we'd call a QRP journal today--that was back when the QRP ARCI had the 100 watt limit and was not devoted to "real QRP.") The Milliwatt was started jointly by me and (primarily) Adrian Weiss, W0RSP, although I ran off after 4 issues to join the Air Force (much better than being drafted and going to Viet Nam!). I was publishing the precursor, a bimonthly newsletter which contained a QRP section. He found out about it, came on board and quickly convinced me to convert to a 100% QRP journal, took over the printing and bulk of the editorial responsibilities, and the rest is QRP history. Although I had a seminal role, W0RSP did the vast majority of the work and deserves 99.9% of the credit for it all.

If you want a copy of the notes I put on the QRP list let me know and I'll e-mail them, although this posting contains most of the detail. (Again, this is a non-profit project, as was my earlier reprinting in 1992; any excess money after expenses are covered will be donated to some small but deserving regional or local QRP club to be determined later--and the Maryland Milliwatts are specifically excluded!)

Again, let me know by e-mail if you are still interested at this price; I'm not taking orders just yet, but will let you know if we go

ahead with the project.

I would like to get a copy of the service manual for the Regency MX-5000 scanner. This radio is about 10 years old and no longer mage by Regency(now Uniden). Can someone direct me to a good source of out of print manuals? Or is there a SAM's PhotoFacts available for the radio?

Getting overtone gate-oscillators to run can be kind of a pain, at times...

Certainly, you are not likely to find fundamental-mode crystals for over
30 MHz in many places (they *do* exist...)

Perhaps the easiest thing to do (what I would do...) is open up the
electronics catalog (I just opened up a jameco catalog) and order
a 100 MHz TTL "canned" oscillator... $4.95, PN 76857.

Now, if you *do* want to build your own oscillator, then you can get
a crystal (custom: >= $11.00) and kludge it into a tank circuit to
force it to ring on the desired overtone, all possibly using an
F or S series gate (or one of those CMOS devices with the goofy
pinout...) and you'll be done... You'll certainly learn more that way:-)

2655. Homemade antenna tap for instruments?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-13 17:54:17 UTC
From: jerald@wrs.com
Message-ID: <Cw2xqI.AKM@wrs.com>
Source record: 116341

I would like to tap into my antenna coax and hook my
frequency counter and/or the oscilloscope to watch
my output signal.

AES has Bird taps at $80.00 which strikes me as being
a little high. (no doubt the product is worthwile but
for what I want to do...)

Is there a simple way to have a permanent tap off the
coax that I can feed to my instruments?

I've thought about taking a few turns of wire around
the outside of the coax and feeding that to the
counter/scope. Though I worry that the
signal level might be too great.

Someone posted here about a tap where they attached
to the shield and a 1 meg resistor to the center
conductor (I think), but I was asleep when that one
went by. If some kind soul still has that post, I
would be grateful.

Anybody have any other ideas?

Many thanks for your time,
73 de KC6RTO.

This comming Sunday.....

Now TWICE the number of outdoor Tailgate spaces are available...

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

FLEA all SUMMER at MIT
September 18th, 1994
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $2 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

!! RAIN or SHINE !! Have no fear of rain, a covered
tailgate area is available for all sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

2665. HP & Marconi microwave power meters

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-14 09:13:37 UTC
From: agodwin@acorn.co.uk
Message-ID: <356es1$qcp@acorn.acorn.co.uk>
Source record: 116365
Cross-posted to: sci.electronics.repair,rec.radio.amateur.homebrew

I have a Marconi-Sanders/TFT 6460/1 power meter, which unfortunately has a blown measurement head : I understand this is a common problem. A replacement is pretty expensive : just the element is #238 from Marconi, and a second-hand head about #100. Very few seem to appear on the amateur market.

However, the heads for the HP meter (HP432A ??) are much more easily available - I've seen guaranteed ones for #25 and unknown ones for #5. Of course, the meters themselves (and the head cables) are pretty hard to find ..

Are the actual sensor elements in these heads similar ? I want to know if I can adapt the HP heads to suit my Marconi meter (perhaps with some changes to the meter), either by building an interface box or by transplanting the measurement cavity into my broken power head.

The Marconi heads are nominally 200 ohm, with a thermistor for temperature compensation and an efficency correction pot mounted on the head itself - I appreciate that the HP meters have the correction control on the meter.

Great accuracy is not particularly important - I could probably get access to equipment to perform some sort of calibration and in any case I'd find relative measurements alone useful if the absolute measurement was OK to an order of magnitude.

I'd also appreciate comments on how these things work : they're usually referred to as thermistor heads, so I assumed that the meter actually measures resistance. However, the manual indicates that it measures voltage, and there's no current source to the sensor, just a small offset voltage that's used for zero setting. Is the same true for the HP meter ?

-adrian

(# above is used to represent pounds sterling, about $1.50).

: All this talk about matching 75 ohms to a typical ham tranceiver reminds me of
: a question I had... BTW, most I have asked this suggest I just try it and see
: what happens :-)

: Your thoughts?

: Greg KD6KGW

Greg: I have 3 dipoles (20,17,15 meters) which are fed with
a single coax: RG59 75 ohms. The swr in the cw portions of
15 and 20 is low (less than 1.2:1 at the low end of the bands) and I can use the 20 meter
dipole for cw and rtty without a tuner. The swr
indicator in my TS440 reads low swr and the rig puts out 100 watts.
These dipoles do quite well on the air.
Since they work well, I haven't lost any sleep about the accuracy
of my 50 ohm swr bridge.

: > Keith

: What exactly is AM Wide, anyway?

My guess is it's like the VHS term that's used for a system or for an improved version of something. Something that sets a standard so that there won't be any one-up-manship in the industry. Probably sanctioned by gov't entities.

I noticed that Radio Shaft is selling their portables with the wider bandwidth. Think about this, though. It's hard to get any analog AM radio to track over the full 3:1 tuning range from 550 to 1600 KHz. Now the FCC has given more bandwidth and it will probably mean that all those cheap radios will have worse than average performance on the edges of the band because of it.

And there are a zillion old radios that are out there that can't receive any stations in the new band addition. So if the broadcaster takes a channel in there, he's losing listeners. I read somewhere that the FCC was going to let some broadcasters simulcast so that they wouldn't be in some vast wasteland. I don't remember if that was on the fcc.gov FTP site or where.

> What about other lightning-safe concerns?

I'm not absolutely certain exactly what you are asking ... but, here are some answers anyway :-)

There is no difference in contact bounce and spikes in switching with a relay, or with the cheap nasty switches that PC manufacturers use.

How to control the relay ? well, you would have to give up a serial port, but just open the port, and use the DTR line to signal the switch box.

The switch box can be something a simple as a 555 timer, driving a (medium) power transistor, driving the supply relay. Kick the timer with DTR line, and relay goes off for a pre-determined time.

How much do you want to spend ??
Some discharge tubes connected across the supply line and telephone line, coupled with a cheapo UPS will probably give you all the protection that you need, for a couple of hundred dollars (and no interruptions of service).

For the curious... an update.

I took the advice of just trying it, and the results weren't too bad.

The dipole actually is 3 dipoles spaced 1.5" apart, and fed with a single
run of RG-8M coax. The dipoles are cut for 40, 20, and 10 meters. Each
required a little pruning to get tuned up, and all work reasonably well.
The 40 meter part also works so-so on 15 meters (it's a little short),
and also on 6 meters. The 10 meter band is so wide that I can't get a perfect
match across the whole thing, but it's under 2:1 for about half of it, and
the tuner takes care of the rest. 20 works the best; I was able to make
a couple of contacts without really trying much during the /125 event a couple
of weekends ago. 40 meters is a little worrysome. The indicated SWR is about
1.2:1 direct into the coax (no tuner), but I seem to have RF everywhere. The
feed line is some 75' long (a tad over 1/2 wavelength), which you'd think
should make things work best. I put a half-dozen turns of the feedline at
the feedpoint as a choke, but it's still there. Suggestions are welcome.

Anyway, thanks for all the suggestions,

Greg KD6KGW/AG

Much of what you need is in an article published by Lee Snook in the 1988 to 1990 ARRL Handbook--A computer controlled Shortwave Converter. All the basic building blocks, VCO, triple loop synthesizer, and digital interface are described.

Get an X-10 appliance module or wall switch. Then get the telephone remote.
When you want to shut it down just call in and power off (or on) the
appropriate x-10 address. You can also controll other things in the house.
A good place for more info is comp.home.automation.

Not necessarily. Suppose there is a parallel resonance from the stray
inductance. You could get a very high impedance over a small range of
frequencies. Often, you see people trying to parallel capacitors to
avoid this problem. Sometimes, it doesn't work because it creates
more parallel resonances!

You're on the right track trying a choke, since the RF is most likely
getting to the shack on the outside of the coax. This can be due to two
causes. One is inherent in connecting coax to a dipole -- the current on
the inside of the shield can flow back over the shield at the feed point.
This is why a choke is usually placed at the feed point. If the feedline
is positioned asymmetrically with respect to the dipole, it also can get
current induced on the outside by coupling to the dipole. To make an
effective choke on 40 meters, you'll need about 15 ft. of cable wound into
6 turns. With a half wavelength feedline, this may not do much good at the
feedpoint, and you may have best results by placing it a quarter wave
down from the feedpoint. More than one choke, placed at quarter wave
spacings, might be required in a severe case. If you want, you can use
about 50 type 72, 73, or 77 ferrite beads on the outside of the coax instead
of the air-core chokes. There's more information on this topic in Chapter 16
of the ARRL Handbook.

Source record: 116223

Hi all:
The UALR ARC is in the process of completing the HAM shack. We intend to operate a 2M repeater along with our other radio gear. The problem is that we have no money to buy commercial gear. We have a Motrac to convert but will have to build the duplexer.

We have the "ARRL Antenna Book", however the information on building a duplexer leaves one a bit hungry. Anyone who has additional information on building a duplexer please e-mail me so I can correspond with you.

Some of the questions I have concern the details of the drawings (they seem a bit limited) and any improved or altered designs that are worth considering.

73's and happy tinkering

Message-ID: <35c6s2$m5l@olivea.ATC.Olivetti.Com>
Source record: 116228

Mechanical filter this unknow item !!!!!

I probably have an idea about how it works but the real question is this
What kind of circuit I have to use if I want to put a cristal
filter in place of a mechanical one ?

What is is the in/out impedence of both kind of filters ?

Can I do a direct replacement mech/xtal ? (I do not belive so)

I have a RTX that have a mechanical filter for SSB (455kHz 3.0kHz large)
and just two coupled/parallel resonant circuits for AM receive.
An AM filter 6kHz is optional and I asked to Scientific Radio (they build RTX)
the price and it is 85 USD and I do not want to spend those money
because I bought this old RTX in a surplus store for about 100 USD
here in Italy.
So i would like to build a xtal filter (may be with some additional
circutry) that can work in place of its own mechanical.
I have 3 455kHz ceramic resonators.

than you for the time you will give me.

Hello all,

A friend and I will soon be tackling a fairly ambitious Senior Design project here at the Rensselaer Polytechnic Institute, and I would like to ask for the advice of those who read this newsgroup.

The project is the design of a high performance 2304 and 3456 (and eventually 5760 ... but not this semester!) tower mounted transverter.

Anyway, getting to the point. I am wondering who y'all would suggest trying to get parts from (we're poor college pukes). I've personally had pretty good luck in the past getting components from semiconductor manufacturers, but have tried very little when it comes to getting samples of RF components.

What we are looking for are the following components for the following modules:

Low noise GaAs FETS for the LNA's :
For practicality, we would like to spec the noise figure of our home-built LNAs at 1 db or so, but I would like to try for 0.5db in practice (I've seen Zack do it, I figure I ought to give it a try :).

Medium Power GaAs FETS for TX :
We have a 20 watt surplus TWT to use, but if that is ever to fail, I would like to have at least 1 watt of solid state RF output if we can find the components. These might also be used to buffer the brick LO's that we might be using.

PIN Diodes:
In our design, we propose a great deal of "module sharing" for each of the bands included in the transverter. For this reason, we will be doing quite a bit of switching. The current design uses 2 relays (for the T/R and for the input to the LNA's), along with many PIN switches. These only need to be good to a few gigs, no real power is being switched.

If anyone has any ideas of who to contact, please clue us in. We've spoken with NEC (they have yet to really respond) and HP (said "no, I don't think so") so far. Anyone know how to contact Al Ward (wb5lua) at HP? Any other hams in strategic places ? :)

thank you for your help!

-Lance Lascari WS2B
(also working with John Barenys, KE4IBF)

Yes, the project is for W2SZ/1. Any vhf'ers reading like to
hear that YES, we're trying to get rid of our multiplier transmitter
on 2 and 3 Gigs!

This is a silicon MMIC; essentially the same as the MAR-3.

2691. Boonton 12 GHz Power Meter 4SALE

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-16 23:30:09 UTC
From: bmork@comtch.iea.com
Message-ID: <35d9q1$4m5@krel.iea.com>
Source record: 116232
Cross-posted to: misc.forsale,rec.radio.swap,sci.electronics,rec.radio.amateur.homebrew,sci.electronics.repair

Boonton Electronics Model 42B Microwattmeter, sn #1038, and
a Model 41-4B (200kHz to 12.4GHz) Power Sensor probe, sn#25600.

The 42B has a mirror-backed 4.5" meter, indicating power on two scales:
from below -10 up to 0 on a dBm full scale, and 0 to 10 on a mWatt scale.
Seven decade ranges go from below 10nW (-50dBm) to 10mW (+10dBm). The
first calibrated mark is at 1nW (-60dBm). A front panel zero adjustment
nulls the meter for lowest power measurements and a calibration factor
adjusts -1dB to +1dB to account for sensor probe parasitics.

On the back panel, 115 or 230 VAC (50-400Hz) is selectable. Recorder output
(0-10 VDC, corresponding to the front panel meter reading) is provided on
banana plugs. A 44-pin card edge connector on the back allows external
programming. Functions include Scale Selection, DC Analog output, and Manual
Disable.

I have no manuals. Frequency ranges and accuracy specs for
probes, plus calibration data for varying temperature and a recorder
output are printed onto the top of the case and internal adjustment
procedures and locations are are printed on the inside of the case.

This meter & probe can be directly compared to the digital readout 42B and
41-4B probe offered by Tucker Electronics (Dallas, TX) for $895 and $350,
respectively, on page 19 of catalog 794B (July 1994). But their price of
$1245 is too much! I'll sell you both the meter and the probe for 60% of
that: $747.00

>my output signal.
>
>AES has Bird taps at $80.00 which strikes me as being
>a little high. (no doubt the product is worthwile but
>for what I want to do...)

You're paying for precision and calibration from Bird.
If you don't care that the tap is exactly 30 db over
a wide frequency range, then you can make your own in
several different ways.

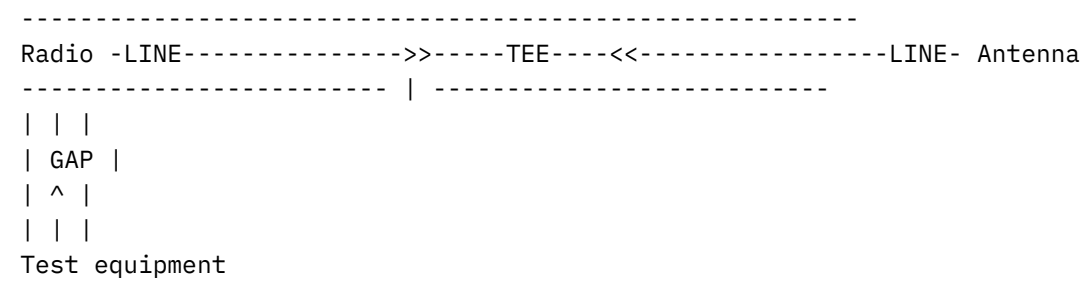
>Is there a simple way to have a permanent tap off the
>coax that I can feed to my instruments?
>
>I've thought about taking a few turns of wire around
>the outside of the coax and feeding that to the
>counter/scope. Though I worry that the
>signal level might be too great.

This often works, especially at HF, and with typically
leaky coax. The idea is that the braid shielding isn't
perfect, and that you can pick up some of the leakage.
Unless the coax is *really* bad, or you have RF on
the *outside* of the shield (a bad but common situation),
then this will work without overloading your equipment.
The more likely case is that you won't pick up *enough*
signal. If that's the case, you can try sliding an
insulated wire *under* the braid for a short distance.

>Someone posted here about a tap where they attached
>to the shield and a 1 meg resistor to the center
>conductor (I think), but I was asleep when that one
>went by. If some kind soul still has that post, I
>would be grateful.

A tap is a better idea. There are basically two ways to
do a tap. One is capacitive coupling, and the other is
a resistive divider. The resistive tap is broad band,
but can cause problems if there is DC on the cable, say
to power a mast mounted preamp, or if signal strength is
increased (burning out the resistor). A capacitive tap
doesn't care about DC on the cable, and is more tolerant
of signal power variations, but it is less broad band.

I make capacitive taps using a Tee fitting and a barrel.
I mill back the center conductor of the male Tee junction
so that it doesn't contact the inner socket of the barrel.
I measure the level at the barrel, and keep milling back
the center pin, a little at a time, until I get a signal
30 db down from the main signal at the frequency of
interest. Looks something like this



These work nicely over a single VHF or UHF band, and can handle any
power level up to the legal limit. The required gap becomes too small
at HF, and arcing can occur at higher power levels. A capacitive tap
at HF requires soldering a chip capacitor of sufficient value in place
of the gap. An inductive pickup works better at HF. That's just a
piece of insulated wire slipped through the braid weave for a short
distance.

If direct coupling by a resistor is preferred (you have to watch out
for DC on the line, and the power rating of the resistor), a chip
resistor can be substituted for the chip capacitor. The value for a
30 db coupler will be on the order of 1.6k.

2693. Where to find (stable) fixed frequency oscillators?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-17 18:59:28 UTC
From: reykowsk@eemips.tamu.edu
Message-ID: <35feag$j1p@news.tamu.edu>
Source record: 116229

Hi,
We want to built a receiver for an experimental magnetic resonance system.
Our experiments will be done at several fixed frequencies in the
range between 40MHz and 360MHz.
We are looking for stable oscillators with low harmonic distortion
in this frequency range.
True, we could buy Xtals and built the oscillators ourselfs, but
it seems so much easier if we can find a source for integrated oscillators.
Can anybody name some companies how built fixed frequency oscillators
in this range?

Thanks a bunch in advance,
Arne

2694. Reuse surface mount parts?

Source record: 116236

I come across a lot of circuit boards with various types of surface mount devices (SMDs) on them, and was wondering if it is practical to unsolder them and reuse them in some homebrew projects which require SMDs, or if it would be far, far better in every respect to simply bite the bullet and spend a fair sum of money to build up a stock of fresh SMDs from a catalog? When you remove SMDs and subsequently solder them again, are they likely to survive? Or do they tend to sustain a lot of damage, or tend to have vastly reduced lifespans? (This is assuming use of low wattage irons with tiny tips, for both removal and subsequent resoldering. Solder paste and hot air reflow would not be used, since this is for work at home.) I realize there are probably a lot of variables here, but in general is this a reasonable thing to do or should I forget about it?

>Can anybody name some companies how built fixed frequency oscillators
>in this range?

I don't think that you are really looking at oscillators in the 40mc &
360mc range, but at ones that multiply up to there...

Go over to your local Motorola Service Station (look in the yellow
pages) and ask them about "Channel Elements". These are very stable,
temperature compensated TCXOs that when purchased new were rather
expensive, but second-hand are in the $5 to $40 range.

They came in two flavors: standard (blue and silver cases) and high accuracy
(gold cases). Some of the receive ones had a VCO function for automatic
locking on a slightly off-frequendcy signal, so for simplicitys sake I'd
stick with the elements designed for the translitters. All of them
worked on a standard positive 9v supply at a few milliamps. They plug
into the circuit in question using 3 pins - the pins are standard octal
tube size and an old Potter & Brumfield KRP-series relay can be
butchered for pins. Depending on the frequency that the
transitter was designed to operate on, they are designed for:
"Low band": 30-36, 36-42, 42-50mc ranges
"High Band": 136-150, 150-160, 160-172mc
"UHF": 406-420, 440*-470, 470-512mc

European commercial mid-range radios are 440-512, American are 450-512.

Most of these have either a 6mc, 8mc or 12mc base frequency, with a rich
harmonic output. A simple multiplier chain can get the frequency you
need. Just take a second-hand Channel element and send it to
International Crystal in Oklahoma City and tell them what frequency you
want the final signal to be, and they will cut the crystal, and install
it in the element, compensate it and guarantee it for ever.

International Crystal also has a standard line of oscillator, multiplier
and power amplifier modules that can be compared to a kids Lego Block set.
More expensive, but if you have the $$$ you can get a turnkey signal source.

However each oscillator-multiplier-power amplifier chain is limited to a little under 10% of the frequency - i.e. 36mc will have all the spot frequencies within about 3.5mc (1.75 on each side). A frequency at 40 would take another complete chain. A 360mc chain could handle about 347-382. The range can be narrowed bu tuning the chain, but not widened. By the way, narrower the range, the better the purity and stability.
This option is less engineering and bench work for you - just give International the frequencies of interest, and let them design the system, but more expensive.

Lastly, check with the used test equipment vendors such as C & H Surplus in Pasadena, CA (818-796-2628 - ask for Rick Fields). There are other, but I have done business with him (there are two Ricks there - ask for him). A HP 8640B oscillator is an excellent laboratory quality oscillator that will do just what you want, from microvolts to volts (into 50 ohms). It is dead-on stable with a short warmup, and can be battery operated if needed, and a IEEE-488 interface is available.
This option is probably the most expensive of the three I've given you, but the simplest. It is also the most versatile - the osc. will cover from (I think) 10 mhz to over 500mhz directly, with no multipliers or anything.

Please let me know what you end up with.

There are a couple of mods that I'm familiar with for the 22s. If the
diode matrix is still in place andworking, then it should be a simple
matter to 'undo' the mod. I have a schmatic and can fax it or whatever.
BTW, the 22S had a very hot receiver for its time (mid 70's). I still use
mine..

Arne,
How stable do you MEAN when you say you are looking for stable oscillators? And what is your budget? (A very simple way, if a tad expensive, to get reasonably stable low distortion signals at those frequencies are prepackaged in almost any of the HP or Fluke or other frequency synthesizers out there. These are usually settable to at least 1Hz accuracies. And they are available with options for state of the art stablility crystal oscillators and will also accept things like Rb and Cs frequency standard inputs for improved stabilities.) (For lesser applications a few days hacking can result in acceptable frequency synthesizers in those two ranges that are useably good.)

I think the advice of a previous respondent to look into frequency synthesizers is a good idea.

Given the frequencies you quote, it appears you are going to be doing NMR on a superconducting magnet. So what you need in stability depends on what linewidths you are going to achieve, how long your experiments will last, and whether you want to go to the trouble of constructing a lock circuit.

Superconducting magnets are usually ok unlocked for all but the most stringent experiments, provided you have the necessary stability in your frequency source.

On my spectrometer, which I use for 'high resolution' solids work, I have a PTS synthesizer, with the cheaper (TXCO) frequency standard. This easily exceeds their long-term spec of 1 in 10^8 per day. Sitting in my lab there are shorter-term fluctuations of about 1-2 in 10^7, which I think is a little worse than you might expect from their temperature spec. Of course some of the problem could be in my shim coil power supply, since the fine shims are room temperature, not superconducting. Since the stability I get is sufficient for what I do, I haven't chased it further.

Note that if you are doing high resolution liquid nmr, you certainly need to do better than I do. I the case of PTS their better standard costs $300 more, and would be worth it for liquid work, unless you build a lock.

: in general is this a reasonable thing to do or should I forget about it?

It's not hard to unsolder 2-leaded devices and reuse them, but resistors
and capacitors are so cheap it's hardly worth the bother.

The best way to successfully recycle surface-mount IC's is to use a special
soldering iron attachment that heats all the leads simultaneously. You need
a different attachment for each size of IC package. Another method is to
use a heat gun. You do run the risk of damaging the parts and the PC board
from excessive heat, and it's very difficult to unsolder just one component
at a time with that method. On the other hand, unsoldering a whole bunch of
components at once makes for a fast salvage operation. Also one heat gun
is cheaper than buying a big collection of special desoldering tools.

Hi!

Electronics Australia published an SSB receiver with an IF of 8MHZ using 3 8MHZ computer xtals in a ladder network configuration. All the capacitors were 100pF. The article said using a ladder network enabled the xtals to be all resonant at the same frequency.

Can the same idea be used with overtone xtals? For example, I would like to build a 48MHz IF filter.

Thanks for any info, Ian

The U.S. medium-wave broadcast band is being expanded. Some stations
will be relocated to new frequencies to reduce interference. Don't
know when this will happen, preparation started a couple years ago.
Ask the MW DXer's in rec.radio.amateur.shortwave.

The wide-band feature is the result of an industry effort for a
better quality AM signal. It was called "A-Max" or something like
that. Ask the MW folks for more info.

: We have the "ARRL Antenna Book", however the information on building a
: duplexer leaves one a bit hungry. Anyone who has additional information
: on building a duplexer please e-mail me so I can correspond with you.

Also recall the arrl handbook talks about alternative to using
duplexers. Isolation can also be achieved by split site, receiver &
transmitter in different locations, but not too far apart, linked by
another band.
Another alternative is same site operation using separate transmit &
receive antennas vertically separted as much as possible. Using RG214
doulbe shielded is a must, but hardline is necessary for minimal loss.
Adittional isolation can be achieved with a simple coffee can notch
filter on the receiver, and maybe another on the transmitter/PA.
If you can build cavaties as well as wacom, telewave & celwave, there
is greate fortune in your future.

2714. Quads and baluns?

Hello,

Upon reading the ARRL handbook from 1988, I noticed that quads,
both for HF and VHF are fed without a balun. However, the quad element
is fed in a current maximum much as the dipole.

Why does one get away without a balun for the one and not for the other?
I should think, that the asymetry will cause distortion of the radiation
pattern and the polarizazion, when the feed cable radiates.

May be it it works reasonably well in a single element or a cubical quad
but certainly not with a quagi!

Any experince/ opinion?

Ian:

This is an interesting thought. I have a filter breadboarded on the bench behind me using 16 MHz microprocessor xtals. It would be really quick to test it on the network analyser to see how well it works at 48 MHz. I suspect that the crytals will be much less closely matched as overtone units. I have these carefully matched for both resonance and series resistance, so the response is VERY close to theoretical.

I'll post the results of my test later in the week.

A torch would most likely destroy any markings, thus rendering the use
of the SMT devices a real guessing game and a lot of time expended in
determining part values, etc.

Reminds me of an article in V1#1 of Byte Magazine on salvaging computer
parts from old computers. This was in the 1975 timeframe. The author
used a torch on the bottom side of the board until the IC dropped or
used channel-lock (tm?) pliars to hold IC until it would come out. :-)

I believe it was in RadCom that I saw a simple method to remove surface
mounted IC's. If you can push a thin wire under the IC, fix one end
somewhere on the board (solder...) and the pull the wire against the inner
side of the IC legs while at the same time applying your soldering iron
to each successive leg. As the solder melts you pull the wire through thus
loosening the leg from the board. I have not tried this myself but perhaps
it is worth a try if you want to exchange one or more IC's on the board.
You >have< to be able to slide the wire under the IC though...

I don't know if this description makes any sense, English is not
what I speak daily.

Zack's right, you want a lot of heat fast in order to remove SMDs without damage. I find a static hot air source ideal (a Weller Pyropen with the hot air attachment works well), but since they're a tad expensive, you can get by with an ordinary propane torch. Just hit the part with the torch (briefly) and tap the board on the bench. If your technique is right, the part will fall off without even a scorch mark. This is something you definitely want to practice before trying it out on an expensive board. If you hold the torch on the board a tad too long, it'll be charcoal.

For soldering a part onto a board, the hot air source is also ideal. Just clean and tin the pads, put a smidge of flux on with a toothpick, set the part in place with tweezers (the flux will hold it), and hit it briefly with the hot air source. The surface tension of the solder will pull the part into perfect alignment on the board. This is a lot easier and faster than dealing with thru-hole boards and parts.

I've never found this to be true. In fact, the markings generally seem
to brighten up a bit after the torch is applied. The markings are designed
to remain readable when the part is soldered, and they are hot air soldered
at the factory. (The factory usually doesn't use a hand operated static
hot air source of course. They usually use a hot oil vapor process or an
infared process, but the heat is the same.)

>Any experince/ opinion?

I always have used baluns with my hf full-sized quads in the past. They
give a balanced feed and are good connecting points.

When I made quagis for 144 and 220 Mhz, I never used any type of balun.
None were commercially available and every new connection privides loss.

On my dipoles, it's about 50-50. Theoretically, you get a more balanced
radiation pattern with a balun.

I do use one on my hf triband beam.

good luck on your research

Yes, it was in RadCom - I wrote it, through the idea didn't originate with me. To correct something that Charlos said, you don't actually have to thread the wire under the IC itself (which is usually impossible), but through the small gap which usually does exist between the *side* of the IC and the legs.

Which method to use depends on what you want to keep intact: the ICs, the board or both.

If you don't care about the board, I agree with Russ: use a heat gun or even a blowtorch (at a distance) to melt all the solder very quickly, together with any hot-melt glue holding the SMD chips down. But this doesn't leave the board in very good shape!

If you want to keep the board but not the IC (as in a repair), your main priority is to protect the tracks which are very fragile. Snip the legs of the IC off, one at a time, using very fine-nosed cutters which don't lever against the body of the IC and tear up the tracks. Then carefully desolder the loose bits from the individual tracks.

If you want to keep both the board and the IC, use the wire method, but work v e r y s l o w l y and carefully to avoid tearing the tracks.

Hope this helps you decide which is the best way...

>
>Jeff NH6IL

They don't put a heat sink on all the leads of the device when the devices
are wave-soldered during the manufacturing process. These days, it's only
the very delicate devices that are hand-soldered onto the board,
everything else is wave-soldered. Last visit to an electronics
manufacturing facility, there was even a machine that automated that process!
The SMT facility was simply amazing, as well.

: through-hole devices can easyly be unsoldered with this tool by heating the
: (afterwards useless) PCB's bottom side.

: Stefan

I've done this too very successfully on SMDs. In many cases the PCB is
damaged but if salvaging the parts is your intention, I think this is
the fastest way to go. If you need SMD resistors and capacitors they
fall off the boards very easily (only two leads).

I looked it up (ARRL Handbook,1987): 'A duplexer is a device that allows the repeater transmitter and receiver to be connected to the same antenna. ...a duplexer will allow the signal from the antenna to reach the receiver while blocking energy from the transmitter.'

The diagram I posted will (and does) work as a 2m/440 DUplexer. It will not work as a 2m duplexer, nor will it work as a 440 duplexer.

DIPLEX: (Webster's Ninth) 'Relating to or being simultaneous transmission or reception of two radio signals using a common feature (as a single carrier or single antenna)'
(quoted as written, even though I think it's oddly worded)

It does that (2m/440 DIplexer), too.

Using a heatsink when soldering transistors is a throwback to the old days when germanium transistors were common. Nowdays, nearly all solid-state devices can easily withstand the temperature of molten tin-lead solder.

Not to sound like a pyrotechnician, but I've never seen a dual band
repeater that was not symmetrical in the sense that it was 2 repeaters
that did not both transmit and receive at the same time. A link might
do that, but why would a repeater? I could go on at length what would
be annoying and problematic with this.

Like I said... I was interested in clearing up the
terminology. I'm not sure what point has been made.

as a reminder, here is one of the early requests:

>Please put me on the list of recipients for duplexer construction mail! I am
>interested in 2M and 70cm duplexers, but I have not found sufficient design
>and construction articles.

My interpretation of this, since 2 bands are mentioned and
duplexers is plural, is that the interest is in duplexer design.

One of these radios which tunes to 1.7 MHz might be interesting to
use with a shortwave converter; the larger tuning range would allow a
larger portion of the SW band to be covered with one crystal.

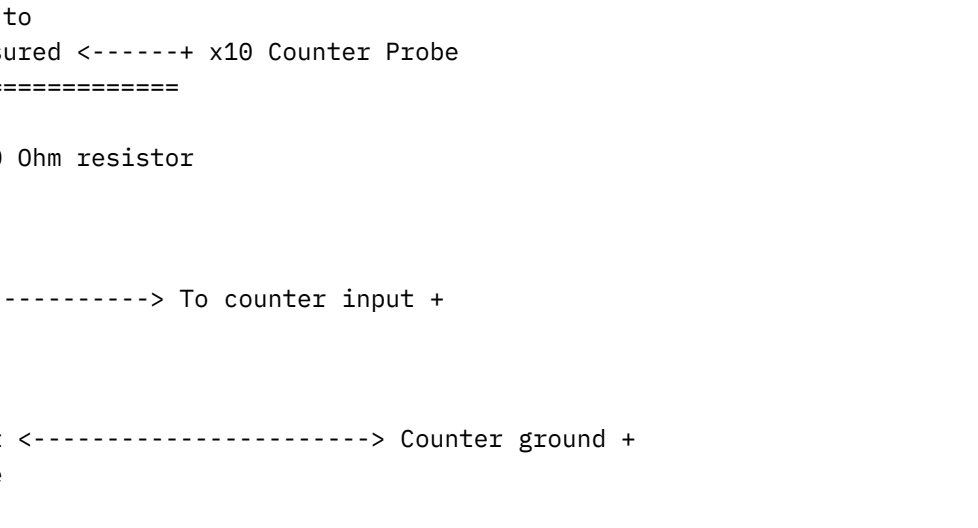
Something like the "x10" probes used on CRO's may be useful to you.
However, these are designed for 1 MOhm inputs. You could build the
equivalent for a 50 Ohm input as follows:



This will present a 500 Ohm impedance to the circuit containing the signal
that you desire to measure. The tradeoff is that the sensitivity drops to
10 mV.

You could replace the 450 Ohm resistor with a 4950 Ohm device. This results
in an impedance of 5 kOhms, but a sensitivity of 100 mV.

There are various other tradeoff that you could use. Construction
techniques will dictate whether the probe you build will operate to

the counter's maximum input frequency without loading the measured
circuit with excessive reactance (due to stray capacitance / inductance).

I would suggest "solid state design for the radio amateur" (I think
that's the title.. I don't have a copy myself) published by the ARRL.
I think it's merely $12 or so, and has lots of practical circuits as
well as good discussion. The ARRL handbook is also a bible for this
sort of information. Anybody have ordering information on the net? I
think the ARRL has some sort of email info services on line.. I'll get
back to ya if I figure them out.

Who says that it doesn't? Many people do not use baluns for simple
dipole antennas, including me. Technical purest will always use a balun
for connecting coax to a dipole. On the same note, not all quads are
fed like a dipole. Some quad designs use a gamma match similar to
connecting coax to a yagi with a gamma match.

Here are some of the pros and cons for using and not using a balun:
(speaking purely of 50 ohm to 50 ohm baluns)

Pros for using a balun:
matches the balance dipole to the unbalanced coax
no rf should run down the outside of the coax

Cons for using a balun:
small amount of RF is lost going through the balun

So,

Pros for not using balun:
no RF lost because of balun

Cons for not using balun:
some rf goes down the outside of the coax
small distortion to wave pattern caused by rf on coax shield

Mainly, in practice it just doesn't seem to matter too much.

>>Heat guns sold at the hardware store to strip paint, etc are generally hot
>>enough to melt solder.

Yes, they actually have too high a temperature, over 800 F, and their heat is spread over too large an area. You can use a variac to cool them down a bit, and sheetmetal nozzle shrouds to direct the hot air exactly where you want it to go. Then they do OK. There are much better hot air sources available, however.

>I've always used a heatsink (needle nose pliers) when soldering
>transistors. Are IC's so heat resistant that no heatsink is
>necessary to prevent damage?

Sure are, and so are most transistors newer than the old point contact types. I *never* use a heatsink, and have *never* lost a modern silicon device due to heat from soldering. Of course you have to have clean tinned surfaces, flux, the right amount of heat, and be quick. A high capacity heat source is better than one too small. If it takes more than a second from application of the heat to flowing solder, your heat source is too small, and heat will have time to migrate up the leads into the device (and down the trace, melting the trace bond to the board).

People make two major mistakes when working with SMDs (and even with leaded parts). The first mistake is to use too high a temperature, and the second is to supply too few BTUs. Remember that temperature and heat are two different things. You want to keep the temperature down, 600 F is as hot as you should ever allow your heat source to be for soft soldering. But you need to have the heat flow way up. This is where the hot air sources really shine. They can deliver a lot of BTUs quickly.

If you are using an iron, tip selection is very important. You don't want a fine conical point tip. That won't allow rapid heat transfer. You want a chisel point tip to give you more contact area. Ideally, the tip will be just as wide as the lead and/or trace that you're working with. It should either be backed by a large thermal mass, or a very good closed loop temperature controller, so that it isn't chilled by the work. And it should be frequently tinned and fluxed so that there's a good heat conducting surface to the contact point. If solder won't flow nearly immediately when you apply the iron, you're doing something wrong, and can damage parts and boards.

Jay,
Check some of the OLD ARRL handbooks (early 80's and late 70's).
They had a couple of amps (FM) that you might be interested in.
One was a 10-15W for handytalky and one was a 10W in 60W out.
Both were solid state and used fairly common transistors. If you
can't get one of these handbooks I'd be glad to FAX or snail-mail
you a copy of them.

Kevin

Just an observation, I have used a Dremel tool with a cutting disk to
cut the old part away. It is quite a bit quicker for things like 40 pin
ICs, but not if you have to go find the Dremel. 8^)

Power running down the Coax does not add to the radiated signal.
When using a balanced design antenna, most designs are, you should
balance the system to get the most signal into the air.

...Unless one uses a balun of a bad design. In that case, such a balun is WORSE than no balun at all.

Not all baluns are created equal(ly) effective.

Yeah that's a good place to start. Depending on your level of
experience and level of interest in really building it from scratch,
you might condider another option: using a hybrid module. I haven't
looked carefully at it, but once you get to buying all of the good
components like UNELCO caps etc, it might even be cost effective.

From my most recent RF parts sheet:

F Pin Pout $$$$

144-148 0.4 43 72

430-450 0.4 45 105

I left out the part numbers, because there are many types to
choose from, these are just examples. They are a bit pricey, but they
are very easy! If it were me, I might consider looking for a surplus
2-way radio.. and stealing the PA... that is if I just wanted to get
the power.

Hi Jay:
Our club is in the process of building a 2M amp from plans found in november 93 "73 AMATEUR RADIO TODAY" page 10. It is supposed to provide about 25-30 watts with 2-3 in. I am currently getting the parts list together so I can give our members an approximate cost. You can get HF, VHF and UHF power transistors from RF PARTS, 435 South Pacific St., San Marcos, CA 92069, 1-800-737-2787 (orders only) or 619-644-0700 (info/technical).

: They don't put a heat sink on all the leads of the device when the devices
: are wave-soldered during the manufacturing process. These days, it's only
: the very delicate devices that are hand-soldered onto the board,
: everything else is wave-soldered. Last visit to an electronics
: manufacturing facility, there was even a machine that automated that process!
: The SMT facility was simply amazing, as well.

SMT parts can be wave-soldered, but it's pretty tough with fine-pitch
parts. Much more likely they are IR or vapor-phase reflow soldered.

With regard to removing parts: if the SMT board you are trying to get
parts off of has parts mainly on one side, or if the parts on the second
side are two-leaded ones that are easy to remove with a pair of soldering
irons (used like chop sticks or tweezers) first, you can get the remaining
ones off the other side if they aren't glued down by putting the board in a
pre-heated oven under a broiler element. I put the board up on blocks
above a sheet of aluminum that will stay cool enough to not damage the
parts; practice with spacing and timing, and take it out just after the
parts fall off. With this method, you are heating through the board
material, and the parts have at least some protection from the heat.
Lighter parts may adhere by surface tension; a quick shake immediately
after opening the oven may help in this case. If the parts are glued on,
you should probably forget trying to remove them for reuse. -- I use an
electric oven for this; dunno how it would work in a gas oven.

Yes Yes, I read all of that too, but our situation doesn't really allow either
option. We can't do split site and we can't get enough vertical seperation to
achieve 100 dB of attenuation. I would rather see the money for the extra
antenna and coax (evey 5 years) go to the cost of the duplexers. I have to
many irons in the fire and haven't had time to start looking for compontents.
I have not recieved info from anyone who has constructed a 2M duplexer. If
I do I will pass it on.

I'll get this thing working yet !

David-

One thought- The circuit looks like it might work, but requires proper phasing of the coil windings. It might suddenly come to life if you reverse ONE of the windings! If not, the turns ratio may be such that reversing primary and secondary may provide adequate feedback for oscillation.

For an RF probe, a series capacitor from the point being measured, to a shunt diode and resistor to ground, may do the job. I suggest 0.01 microfarad ceramic capacitor, 1N4148 or 1N914 silicon switching diode and 1K ohms, 1/4 watt resistor. These parts are not critical. I suggest keeping the leads short and direct.

The drain terminal (output) of the FET looks like a good spot to measure. You might build-in the diode circuit, to provide a test point for circuit tuning or future troubleshooting.

Mike-

I'm sure there is a limit to the temperature these devices can take, but it may he higher than some people think. The main problem, as I see it, is that the solder required for these devices, is NOT ordinary tin-lead alloy.

If ordinary solder (63-37 tin-lead) is used, the lead can almalgamate with the silver that is fired onto the component. The result is that you can no longer solder to it. You must use something like a "silver-saturated" solder, or the appropriate solder paste. (Note: this is not the same as "silver solder", which has a much higher melting point.)

Looking for a 3/32 inch (2.5 mm) three contact (stereo)
miniature phone plug for a Alinco HT to TNC cable.

Gad, these are hard to find! Best I can do so far is
an adapter from Radio Shack, not just a plug. Any
suggestions?

>. . .

The only loss in a current balun made with an open-air coil of coax or external ferrite beads is due to I-squared-R loss where the I is the undesired current flowing on the outside of the coax. If it's significant, the current on the outside of the coax is large (indicating a need for the balun unless you want the current there) and the balun isn't well designed.

The desired current, on the inside of the coax, is totally unaffected by the presence of the balun.

Oh, it most certainly *does* add to the radiated signal. It adds
vectorially however, and may not give you the pattern you expect.
With a simple dipole, though, the pattern isn't much to write home
about anyway unless you're using the nulls off the ends for some
purpose.

I'm looking for a reference to a high voltage screen power supply for an RF high power amplifier. I'd like a shunt regulated supply so that it has a low impedance and preferrable variable voltage around 300 to 400 volts or so. I know that basic regulators can be made using VR tubes but I'm looking for something more robust and with some adjustment capability. I'm sure that I've seen one in some magazine in the past but my memory fails me. Anyone remember seeing one and where?

Rather than going QRO (which might cause problems for others on the band) why not consider improving your antenna? If you're having trouble at home getting into a particular repeater try building a Yagi with as many elements as you desire.

Years ago I lived in a fringe area so I put up a vertical dipole with a `rounded' corner reflector behind it (more of a parabolic shape than a corner/square shape); needless to say I was no longer in a fringe area...

The idea of using brute force to get into a repeater seems unnecessary and wasteful (unless you need the amp for mobile operation; if so then please use it sparingly).

2766. Can combine two 50MHz Tx signals?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-26 01:27:58 UTC
From: acooney@netcom.com
Message-ID: <acooneyCwpqqn.2J3@netcom.com>
Source record: 116205

Greetings:

I'm looking for your suggestions on combining two or more six meter signals. These are in the 100 milliwatt range, and are relatively closely spaced (100-200 KHz). I need a broadband solution (untuned) if possible, so that the transmitter frequencies can be varied within a few hundred kilocycles or so without altering the need for a 'tune up'.

What the heck is this for, you ask? I work for a company that builds remotely controlled models for the movie industry. We use six meter RC equipment with one power amp and antenna per RC 'channel', and that can add up to a rack of power amps and a field of antennas for a given shoot. We'd like to be able to combine at least two signals before amplification -- to cut the number of amps and antennas we have to fuss with.

Any ideas? Cheers all. :)

Alan

>Alan
>WD6DES

Alan, you can resistively combine the signals quite easily. Or you can use a fairly simple "balun" arrangement to combine the signals. If you try to do so at the amplifier output you must use the combiner (balun) approach. And when you do you will take an instant 3dB power loss to the antenna. (Half goes into the load and half into the normally zero power dummy load resistor. It is only zero power when you are combining two copies of the same signal that are at the same amplitude an 180 degrees out of phase.)

If you try to amplify the combined signals after combining you MUSt use a linear amplifier and run it such that none of its intermod products on any of the signals into it "leak" into portions of the spectrum you are not licensed to use at any power levels that someone licensed to use those frequencies might consider injurious. (The fine can ruin a whole day, each day you do it.) True linear amplifiers cost much more per watt out than do typical FM amplifiers.

If I were designing the control system from the ground up I'd go digital and use TDMA (Time Division Multiple Access) so that I could control all the signals on one power amplifier and antenna system. But you'd have to select an appropriate chunk of spectrum for it if you wanted to do it, I suspect.

Hi !

Does anybody out here have any design formulae to build narrow-band inter-
digital filters ?
Typically, I need a filter centered on about 1297 MHz with more than 90 dB
insertion loss at 1291 MHz. The French SHF repeater shift is - 6 MHz.

Thanks,
Vincent

Heh, heh, maybe that's why Tektronix gear is so much more reliable.
They used to include a little role of silver bearing solder in
every instrument so the tech could fix it right.

(In the old days that was because of the silver bearing contacts on
their ceramic terminal strips, but it applies to modern SMDs too.)

It's true that using ordinary solder can cause the silver to leach
out of the contacts on SMD components. That can lead to connection
failures. That's primarily an issue with leadless SMDs like caps
and resistors. It doesn't apply to leaded ICs. Their leads are
tin plated, and solder fine with ordinary solder.

Ahem. If you really mean the 6 meter amateur band, I want the name
of the company. Using amateur radio for commerical gain is still
illegal.

If you mean commercial frequencies near 6 meters, then the way to
get around the rack of amps and field of antennas is to use Wilkinson
combiners on all the transmitters and feed them into a single linear
amplifier. Make sure the amp is really linear though. One that will
pass a broadcast TV signal will work. A low band CATV master distribution
amplifier would be a good choice. That can then feed a single antenna.

Ouch! That's tough. To get that much rejection, your insertion loss on
the desired receive channel is going to be really high, probably as much
as 10 db. I doubt that will be acceptable. You should stick to standard
cavity notch duplexers instead.

... or to put it another way, ordinary solder dissolves the silver out of the
plating on the component. Obviously this phenomenon only affects ceramic-bodied
compnents such as Rs, Cs and Ls. ICs and other devices with solid metal
legs can be resoldered for as long as they hold together :-)

> Wow, I never heard that before. We use standard tin-lead solder all the
> time around here for soldering SMT devices.

Well, yes - ordinary solder is OK for first-time use of components, but
each repeated application to reclaimed components (and that includes 'cleaning'
old solder off them) makes the ceramic-metal connections less reliable.

I never re-use chip Rs (they only cost pennies), and always suspect the
joint continuity of re-used chip Cs.

Regarding the hot air / blowtorch method of stripping boards, GM4ANB recommends
doing it over a bowl of cold water. If the components (ICs in particular) are
sealed as they should be, they'll benefit from the immediate cooling.

My meager selection of data books do not have any information on the the following:

RCA 400 or 40341 (device has both of these markings)

2N6485 which is a tiny metal cased 6-pin device.

The RCA device was pulled out of a "50 MHz oscillator" purchased at a hamfest for $1. The thing was cold soldered (no wonder it didn't work).

The other device was pulled from a PC board of some type.

Thanks for any answers for these two--I would like to use the RCA device at two meters if it is rated for that high a frequency.

From an OM, who has calculated many beams, I was told that a properly symmetric
feed becomes increasingly important with increasing antenna gain.
Therefore a folded dipole with cable balun is better than a gamma
match.

Greetings Larry:

I have been a radio amateur for about 30 years, I have my commercial ticket and my carreer was in telecommunications engineering. I have been involved in two home brew 2 metre duplexer projects.

I can say from experience that building home brew duplexers is a major project that requires the tools and expertise of a good machinest plus the availability of expensive test equipment to properly tune up the duplexers once they are constructed. But it can be done with many many man hours of patient effort and they can be made to perform near equal to commercial duplexers but may never be as stable. A duplexer project was described in an old version of FM REPEATERS FOR THE RADIO AMATEUR ARRL publication (1972). They were fabricated from 4 inch copper drainage pipe. If you decide to build this set I have some advise about the harness cable lengths.

My advise in general is that unless you have a lot of time available, get a great deal of personal satisfaction out of making your own duplexers, have the availability of a good machinest and access to a good spectrum analyzer with a tracking generator option you should put an effort into finding a good set of commercial duplexers from the used equipment market. Some commercial duplexers have been showing up on the surplus market for about $300 which is probably less than it would cost to build a set. Be carefull however to ensure that they can be tuned down to the 2 metre band. Some of the hybrid ring duplexers had the plunger rods cut off so they could be rack mounted and the cable harness is frequency sensitive. It can cost $300 for a new double shielded cable harness! Don't bother trying to utilize single shielded coax for the harness or the transmitter and receiver antenna cables. Single shielded coax is ok for the antenna feedline but you may wish to use a type of heliax there for loss considerations.

It takes man months of effort to build a set of duplexers and it can be enough to fold a repeater club if you do not have the facilities and expertise available.

Good luck with your project and most importantly have fun with it.

2779. Need Help: measuring coil resistance

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-26 17:15:05 UTC
From: tkreyche@zdlabs.ziff.com
Message-ID: <tkreyche-260994091505@tomkreyche.zdlabs.ziff.com>
Source record: 116119

Dear homebrewers,

I'm working on a commerical seismometer (for measuring distant earthquakes) and don't understand some coil phenomena.

The instrument has an coil of very fine wire (about #44) wound on a hollow plastic core, probably >> 5000 turns, about 1.5 inches in diameter. Horizontal earth movement causes this coil to move in and out of a strong magnet, which generates a changing voltage.

If I remove the magnet and measure the coil resistance, it shows a rock steady 48.1 k ohms.

With the magnet in place around the coil and with the coil locked so it can't move, the coil resistance bounces slowly betwee 47.6k and 48.5k.

The measurements are made at a stable room temperature using a fluke 75 multimeter. I imagine the meter works by running a small current though the DUT and measuring voltage across a resistor, so naturally any change in current in the DUT will play hell with the measurement.

Why does the resistance appear to change with the magnet in place? Is it simply due to very small thermal movements, even though the coil is locked? or is something else going on, like changes in the earth's magnetic field or something more mundane?

Thanks, Tom KG6YJ

: it may he higher than some people think. The main problem, as I see it,
: is that the solder required for these devices, is NOT ordinary tin-lead
: alloy.

: If ordinary solder (63-37 tin-lead) is used, the lead can almalgamate with
: the silver that is fired onto the component. The result is that you can
: no longer solder to it. You must use something like a "silver-saturated"
: solder, or the appropriate solder paste. (Note: this is not the same as
: "silver solder", which has a much higher melting point.)

Hmmm. This "not ordinary solder" goes against what we do here, so I thought I'd have a look in a component supplier catalog. I only checked Kemet, but I'm pretty sure others are similar. They specifically mention 62%Sn standard tin-lead solder for mounting. They also diagram their end terminations--this was specifically on multilayer ceramic capacitors. The end terminations are thick film silver, electroplated with nickel, electroplated with pure tin. They call these "solder-guard" or some such trademarked term.

One thing of interest was their recommended mounting, in which the capacitors are spaced from their pads by a significant amount of solder; the solder is supposed to accomodate the differential thermal expansion between the board material and the capacitor substrate. They specifically recommended against mounting the capacitor hard against the board (pads). Just how you accomplish this in an automated IR or vapor phase reflow system I don't know, especially with components on both sides of the board.

Cheers,
Tom -- K7ITM

>looking for something more robust and with some adjustment capability.

There are two in the _VHF/UHF_DX_Book_ (from ARRL) which were designed for 4CX250/350s and similar. They use op-amp regulation with either bipolar or power MOSFET shunt elements, and are well proven designs with good protection against short-circuits and flashover. Regulation is +-100mV or better - more than you'll ever need.

I've had a similar MOSFET design running for about 3 years which also has opto-coupled overcurrent shutdown. There's a new PCB for this 'in beta' which will be configurable for voltages from 200 up to about 600, in any grounding configuration, and should be a universal retrofit for existing screen supplies using VR tubes and zener stacks. More details later...

(Excuse the boost for the book, but that's where several of us assembled a lot of good information that wasn't easily available anywhere else.)

I had the same problem with my DJ1F/T and KPC3. Maybe these
guys don't exist. So I thought, so what if it is an adaptor,
just make the cable 1/2 inch shorter and use a 3.5mm plug.
It has been in use for a year and a half with no reliability
problems.
OK, so it may not look so 'professional', but REAL ham shacks
are not not supposed to look good. (;-)

Hello I have a linear amplifier that has had the finals removed. I have the new finals. They are npn, but i'm not sure how to tell wich way they should go in the amp.
There are only two possibilities because of the heat sink. There are two broadband ferrit transformers directly across from each other. Should the final be placed so that the base goes to one and the collector goes to the other, or should it be placed so that the two emitters go to them?
Thanks Robert

I have a TRW Swap-Meet-Special converter that uses what looks like a balun to feed input into a SO-42P IC, a Siemens Double Balanced Mixer IC, (14 pin). Trying to decide if this is a low or hi z mixer input?

I have tried thru Siemens USA, to get a data sheet for the SO-42P IC with the reply, "OBSOLETE".

Can someone provide me with the estimated input impedance to the mixer port, pins 7 and 8 and impedance of output port pins 2 and 5,3? Return-Loss and Phase data is OK too.

Really appreciate assistance with this old part and obsolete data sheet.

Thanks, Dave

2789. Building MFJ 8100 Gennie SW receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-27 06:11:05 UTC
From: keen@phakt.usc.edu
Message-ID: <368d1p$241@phakt.usc.edu>
Source record: 116136

Hi!

I am a person who is contemplating getting my Tech plus ticket as soon as an exam is given where I can get to it easily. Since I want to get into HF listening and brush up on my CW cheaply while I wait, I got a MFJ 8100 kit. It is a modernized regenerative receiver using 3 FETs and a LM386, receiving AM, SSB, and CW on all amateur HF bands.

I decided to get a regenerative kit because it can recieve more modes than a superhet can in a simple kit, and because the MFJ 8100 got good reviews.

Anyhow, before I started and risked messing up my $60 kit, I wanted to get some 'been there, done that' advice from folks who should know.

I have already built some simple kits (like a logic probe) and I know how to solder fairly well. (I've got a 15w iron with a grounded tip and a spool of 0.015 solder) I also know about polarity of components, the importance of keeping leads short, why cold solder joints are evil, and basic stuff like that.

I was wondering if anyone has any kit-building traps to look out for or any experiences that I can make use of.

Thanks!

Ben Keen

2790. Torroid on feedline absorbs power?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-27 06:22:58 UTC
From: acooney@netcom.com
Message-ID: <acooneyCwrz2B.Ht8@netcom.com>
Source record: 116137

I've an antenna in a harsh environment, where the feedline can get s
wet at various points. The varying wetness causes shifts in VSWR that
are unpredictable, as they appear to hit 'nodes' in the feedline. I
looped the feedline many times through a ferrite torroid located right
at the feed of the dipole, and the result has been a reduction in the
effect I was seeing before -- apparently due to a reduction in signal
travelling on the outside of the coax. So is that external energy
being absorbed by the ferrite (ie., wasted power), or is the torroid
giving me a high impedance 'choke' -- effectively just closing the door
on that rf path? Oh, and the frequency is ~50MHz.

Ideas or comments? Thanks for your time. :)

> cavity notch duplexers instead.

A notch duplexer is propably the best solution if you must use a common antenna for both RX and TX _and_ you have a clean site. However, if there are strong FM and/or TV transmitters on the site to worry about, you still need some band-pass filtering between the duplexer and receiver with additional insertion loss.

If you can install separate Rx and Tx antennas and move them as far as possible from each other and you can get away with much simpler filters. Due to the short wavelength, you need only 1/9 separation for the same isolation as would be required on 2 m. The other nice feature is that you can use the structures of the tower as a shield between the Rx and Tx antenna, as the diffraction around obstacles is much less than on lower frequncies. The drawback is of course that the nulls in the radiation pattern occure at different directions for Rx and Tx. We are currently using band-pass filters for 1291/1297 MHz and the antenna separation of only about 6 m but with a solid metal tube about 1 m in diameter between Rx and Rx antennas.

One more trick that we are using is that the main part of the Tx-side selectivity (to filter out the phase noise falling on the Rx frequency) is before the power amplifier and only moderate filtering is used after the power amplifier mainly to filter out harmonics generated by the power amplifier itself. It is much cheaper to loose some milliwatts in the the tx-duplexers (which can be compensated with an additional low power stage) than loose a few watts.

One other nice feature about band-pass filters on receive is that the transmitter signal is usually the only strong signal that you have to worry about, i.e. you have to attenuate it so much that it is below the 1 dB compression point of the preamp and after the

preamp you can use additional filtering without worrying too much
about insertion loss.

However, when using notch duplexers, there is allways the risk that
strong out-of-band signals generate third order (and higher order)
intermodulation products with our own Tx-signal that are stronger
than the noise level at the Rx-frequency even if all signals are
well below the 1 dB compression point of the preamp.

I think Lance is refering to "Computer-aided Interdigital bandpass
filter design" by Jerry Hinshaw, N6JH and Shahrokh Monemzadeh
in Ham Radio Magazine, January 1985 pp. 12-26.

I haven't tried the program, thus I don't know what selectivity can be
obtained with a narrow passband. The 1296 design example was calculated
for a 20 MHz passband.

: additional insertion loss.

The site is already almost covered with various antennae. In fact, it's the highest place in the immediate viciny of Paris. There are already two repeaters here, VHF and UHF. That would complete both. But there are also a whole bunch of professional repeaters.

: If you can install separate Rx and Tx antennas and move them as far as
: possible from each other and you can get away with much simpler filters.

Unfortunately, the antennae are installed atop a building, so I don't think there'll be much space...

As you suggest, I could use a notch filter to remove the Tx frequency. Let's assume an output power of 50 W, and a receiver sensitivity of 100 nV. That'd mean something like +17 dB output and -157 dB input, 160 dB of loss. Of course, I have no idea a priori about the spurious power on the Rx frequency. Could I insert another notch filter in the Tx path to remove any energy at the Rx QRG ?

: However, when using notch duplexers, there is allways the risk that
: strong out-of-band signals generate third order (and higher order)
: intermodulation products with our own Tx-signal that are stronger
: than the noise level at the Rx-frequency even if all signals are
: well below the 1 dB compression point of the preamp.

We have precisely the case here because our frequency is polluted by harmonics of a tracking system (SYLTRACK) every 15 kHz between 430 and 434 MHz, our phonie sub-band. Thus, each time we use the repeater, unless we have a very strong signal, we are covered by a horse like noise :-(

: I think Lance is refering to "Computer-aided Interdigital bandpass
: filter design" by Jerry Hinshaw, N6JH and Shahrokh Monemzadeh
: in Ham Radio Magazine, January 1985 pp. 12-26.

Thanks for your advices ! Do you know where I could possibly find the source ? It's really pretty hard to get Ham Radio Magazine over here, so imagine for old issues !!! :-(

Thanks again and 73s !

FWIW, there's an article in the April, 1979 QST on constructing a 2m duplexer from copperclad stock. It sounds easy enough, but you know how projects like this tend to expand to occupy all of your time. There's a lot of little details to take care of - for instance, the author recommends silver plating all interior surfaces, and polishing all hardware inside. Claimed isolation is 81 dB.

Source record: 116130

I agree with Gary about the legalities. You should IMMEDIATELY desist if you are using 6M even if you are a licensed amateur! Given the current mood of the FCC, you could get some VERY big fines for this if caught.

Now to your technical needs. If you haven't been in model RC stuff very long, you probably are not aware of the history of the current specifications. The channels were narrowed, the modulation bandwidth was narrowed, and more channels were added. The suggestion that Gary made is a good one if you are using the 72MHz stuff. The only problem is that you will be doing this illegally, too. This is Part 15 equipment and must be type approved before use. This means you are not allowed to mess with the antenna or have external power amplifiers.

Are you also aware that in the 72 MHz region that there are 2 sets of frequencies? There is one set for cars, boats, etc. and another reserved for airplanes.

You really need to get a legitimate frequency band for this type of work. There are other ways to do this legally. I haven't read the regulations lately but you could probably build your own encoders and decoders and use a legitimate 72 MHz band transmitter to transmitt to all models simultaneously. The electronics for the encoder and the receiver would get pretty messy, and the response may slow down a bit, but it would be legal.

I will be happy to correspond with you directly on technical matters. It would seem that you REALLY need some legal help with the FCC to get some spectrum allocated for this use! One option is using an ISM (industrial, scientific, medical) band for this. The problem here is interference from other users of the band.

Again, write if I can be of further help.

If the magnet is REALLY strong, it would only take a very slight movement of the coil to induce current in the coil. The level of current that is flowing when making the measurement is on the order of a few microamps, so it would take very little to upset the measurement by 1%. I doubt that you are able to totally immobilize the coil. Even putting you hand down on the bench next to the coil is probably enough to get measurable current.

Jeff:

I believe that Phillips has discontinued the 561. However, the 564 should be reasonably close in features unless that is the one that has all the neat AM synchronous dtection stuff in it. If that is the case you may be able to redesign your circuit around an NE602 and/or NE604 and NE564 all of which are still in production.

>on that rf path? Oh, and the frequency is ~50MHz.

If the toroid is absorbing a significant amount of energy, there can be only one possible result: it will get hot.

Most of the ferrites used for this purpose have a mostly resistive impedance at the frequency of use. This means that they will dissipate power if current flows through the winding(*). The object, though, is to reduce the current to a very low value. If the winding has a sufficiently high impedance, the current will be small, and the dissipation in the core will be negligible.

73,
Roy Lewallen, W7EL
roy.lewallen@tek.com

(*) To be more specific, we're talking about the NET current through the winding. In the case of coax, this equals the current flowing on the outside.

Allan,

The losses in your choke depend on the material used. I guess
that on 50 MHz most ferrites will be quite lossy.

The best solution will be to use a proper balun, as published
by the ARRL and others.

IMO the best is to build a folded dipole with a 4:1 cable balun.
or replace your dipole with a groundplane.

Hope you will have success, Moritz DL5UH

> 2N6485 which is a tiny metal cased 6-pin device.

jim-

The RCA "400" is possibly a date code. There is an RCA 40341, "High-Power 50-MHz Emitter-Ballasted Silicon N-P-N Overlay Transistor" listed in a 1978 RCA data book. It is rated at 30 Watts minimum output at 24 Volts DC, 10 dB minimum gain, infinite load mismatch tested at 50 MHz. It is in a JEDEC TO-60 case, with leads in a standard onfiguration (E-B-C going clockwise).

ICE0(max)=1.0 Ma at Vce=30
ICB0(max)=10 Ma at Vcb=50
V(br)CE0(min)=35 at Ic=200 Ma(pulsed)
V(br)CEV(min)=70 at Vbe=-1.5, Ic=200 Ma(pulsed)
V(br)EB0(min)=4 at Ie=10 Ma
Thermal Resistance = 2.5 degrees C per Watt (typical?)

Poe(min)=30 at 24 VDC, 3 watts drive, 50 MHz
Gpe(min)=10 dB at 24 VDC, 3 watts drive, 50 MHz
Cobo(max)=85 pF

I hope this is of value. The RCA book jumped right over the 2N6485, so it is probably made by another company.

I think this is a misdiagnosis and that a toroid "choke" is not the
right fix. If you're getting standing waves apparent along the
outside of the coax, you've got some *serious* mismatch going on to
begin with. Check the *end* insulators, which must provide high
isolation despite moisture. Re-check the antenna's tuning (remember
grid-dip meters?) for the frequency you're using and feed your dipole
through a balun. While you're at it, see that any guy lines are
broken up with insulators to prevent resonances and that the antenna
is sufficiently far (say, a few wavelengths) from conductive
structures.

OTOH, if your coax is wicking water *inside* along the braid, that can cause some interesting effects as well.

Alan-

Since you appear to be in the U.S., I assume your "six meter" signals are actually in the 49 MHz range, covered by FCC part 15 rules. Regardless, what you want to accomplish may be better done on other frequencies with less chance of interference from other users.

One approach might be to use multiplex, much like is done with multi-channel microwave links. Signals from the different controllers can each modulate a sub carrier. The sum of all the sub carriers can then FM modulate a main carrier, which is amplified (using class C amplifiers) and transmitted. Circuitry similar to Broadcast FM Stereo decoders, might be used at the receivers to decode the correct subcarrier. (Look for "SCA" decoders.)

Another approach might be to use spread spectrum techniques, using hardware that is appearing on the market for unlicensed wireless LAN applications, et cetera. I understand there is equipment coming out for the 900 MHz band, as well as somewhere up in the 2 GHz range. An advantage of spread spectrum, is the ability to co-exist with other users, assuming no one user has so strong a signal as to overload the other user's receivers.

The energy is not being lost. You are correct in the assumption that the

choke is "Closing the door on that rf path."

It is my understanding that wrapping the coax around the torroid core is not very effective as so little of the cable is in contact with the core.
You might want to try installing a "Current Balun" which consists of many torroids just big enough to pass over the cable. I beleive that Amidon amoung
others will sell you the parts or finished units. Since you are operating at
50 MHz a typical HF balun won't work. You will need to specify that you need a balun that will work at 50 MHz. Hope this helps.

I haven't seen the earlier parts of this thread, but there are channels set aside for RC work ON six metres. From 50.8 to 50.98, every 20 KHz is a channel for RC. Granted, you need to be an amateur to use this, but why would the FCC frown on this?

*** END OF LISTING ***

This came from Ham Radio magazine a few years ago...

I appologize for not being able to credit the appropriate parties, but I loaded my copy of the magazine to someone... for this program, in fact...

Here is a version of the program you want. I do not know if the algorithms are valid for the very narrow bandwidths you
need - your milage may vary HI.

```
10 KEY OFF: CLS
20 COLOR 3, 0: LOCATE 2, 16: PRINT "DESIGN DATA FOR INTERDIGITAL BANDPASS FILTERS": COLOR

>about the harness cable lengths.

The comment about stability was not emphasized enough. The commercial
duplexers are made of an alloy that is not as sensitive to temperature
as regular copper. You may be able to build a 2m duplexer that works
very well, but it may be totally detuned the following winter.
On the other hand, if your repeater site is inside (or otherwise
thermally stable) it may work OK.

> My advise in general is that unless you have a lot of time

>L>I from anyone who has constructed a 2M duplexer. If do I will pass it
>L>on. --

I once saw a home-brew 2m duplexer on the RTTY repeater in the Los Angeles
area (what caught my eye was the chrome plated shower "C" handles on the
receiver cavity tuning screws and the "H" handles on the transmitter side...).
If someone has an older repeater directory (from the late 80s/early 90s)
look for a W6xxx-type callsign on a "Contractor's Point" site under
the SCATS club on 146.70. Look him up in the call book and drop him a note...

: Desole Vincent, je sais que l'anglais n'est pas ta langue maternel mais j'ai
: bien aime la blague.

By sub bands, I mean that the 430 to 440 UHF band has been cut into various
"subbands". E.g. the 430-431 is devoted to repeaters, 431.25 to 431.75 is
packet, etc... (This is not the true mapping, but it s just to give an idea)
So we have the repeaters subband, packet subband, ATV subband, ...

BTW, our shift for UHF repeaters is 1.6 MHz, therefore all the upper part of
the band (434 to 440) is devoted to ATV.

So, it is not the Eiffel tower, which has a really impressive antenna farm.
This farm has certainly grown since I wisited the place a few years ago :-)

> There are already two repeaters here, VHF and UHF.
> That would complete both.
> But there are also a whole bunch of professional repeaters.

Appearently you do not have any high power (> 1kW) transmitters on the site
and thus a notch type duplexers with some additional band-pass filtering
could do.

> : If you can install separate Rx and Tx antennas and move them as far as
> : possible from each other and you can get away with much simpler filters.
>
> Unfortunately, the antennae are installed atop a building, so I don't think
> there'll be much space...

With only one antenna this pretty much narrows down the choises to standard
cavity notch filters as Gary suggested. Duplexers with 6 MHz separation
are available at least from Sinclab (ph:+1-905-841-0624, fax:+1-905-841-2315)
with 70 dB deep notches.

> As you suggest, I could use a notch filter to remove the Tx frequency.
> Let's assume an output power of 50 W, and a receiver sensitivity of 100 nV.
> That'd mean something like +17 dB output and -157 dB input, 160 dB of loss.
> Of course, I have no idea a priori about the spurious power on the Rx
> frequency. Could I insert another notch filter in the Tx path to remove
> any energy at the Rx QRG ?

The standard practice in notch duplexers is to tune the _transmitter_
duplexer at the receiving frequency. If you really can get 100 nV sensivity
(-127 dBm) the noise floor is propably at -135 dBm (at 16 kHz bandwidth).
With a -70 dB notch, the transmitter phase noise at -6 MHz should be less
than -65 dBm or 112 dB below carrier (at 16 kHz BW) or -70 dBc/Hz at
-6 MHz offset, which is not a very stringent requirement.

A -70 dB notch at the transmitting frequency in the _receiver_ duplexer
will reduce the transmitter power from +57 dBm to -13 dBm which is still
a lot for a mid-UHF preamp and it will require a more than 100 dB dynamic
range. Clearly some additional filtering should be employed in order to
not to overload the mixer in the receiver.

> We have precisely the case here because our frequency is polluted by
> harmonics of a tracking system (SYLTRACK) every 15 kHz between 430 and
> 434 MHz, our phoniesub-band. Thus, each time we use the repeater, unless
> we have a very strong signal, we are covered by a horse like noise :-(

You need a 1291 MHz band-pass filter prior to the preamp, since the
attenuation is insignificant at 430 MHz in a notch type duplexer.
A 1/4 wave shorted stub (at 1291) might do the trick (or it might be
insufficient). To conclude, a duplexer, some bandpass filtering prior
to the preamp, a preamp with good strong signal handling characteristics
and some additional band-pass filtering between the preamp and the
receiver should be employed.

The Tour Eiffel is a high place, you re right. But it costs a lot of money to
install an antenna, because there is really little space. Still, there is a
400 to 1200 transponder here, courtesy of a commerical FM radio which gave a
small place to install it.
Whereas le Petit Clamart is on a hill - probably higher than the top of
la Tour Eiffel, and the roof is free !

AC>Any ideas? Cheers all. :)

AC>Alan
AC>WD6DES

Greetings Alan:

If you can accept 3 or 4 dB of loss (that would decrease your
output power to 40 mW or so per TX) an inexpensive combiner for two
signals could be made from a 75 Ohm CATV splitter connected up in
reverse (the combined tx signals come out the IN port). These splitters
typically provide isolation between the two output ports and are usually
designed to work from 5 to 300 MHz.

Make sure your amplifier is operated in a linear mode as
otherwise your tx signals will mix and generate intermodulation products
that could cause interference! I would suggest you do a careful test for
intermodulation in advance. Typical SSB amateur radio power amps just
may not be linear enough for intermodulation considerations.

Using multiple turns on a single core works fine, if the coax is small enough and the core large enough. This is what I use for all my antennas, with RG-174 coax. There's no benefit in having more or less of the cable be in contact with the core. Using multiple turns on a single core has a large advantage, in fact. The impedance goes up as the square of the number of turns, so 10 turns around a single core is equivalent to having 100 cores along the outside of the coax. The benefit to the W2DU approach (a string of cores on the outside) is that it's usable with large coax like RG-8.

Hi all:
Thanks for the responses. I was beginning to think that no one was out there.
In answer to your comments, the graduate program that I am enrolled in is
in applied science. Our faculty sponsor is a professor in this program. The
department (Applied Science) has a complete machine shop and several HP
spectrum analyzers. The Engineering Technology department is a co-sponsor and
has more test equipment than you can shake a stick at. BTW the machine shop
comes complete with a machinist, Who I can usually get to let me use the less
complicated equipment or talk into machining a part I can't make, time
permiting.
So the questions I have concern details that are not in the "ARRL ANTENNA
BOOK". Detailed schematics and test proceedures, etc.
73's
Larry

From: jwill@cabell.vcu.edu
Message-ID: <1994Sep29.092538.18283@cabell.vcu.edu>
Source record: 116157

What Terry says is correct. To make a good current baleun for 50 MHz
you will need some torroid cores to slip over the outside of the coax
right at the antenna feed..... A quick check of the ARRL Antenna
Handbook fives the following information about what type of torroids
to order from Amidon:

For RG-58 type coax: Use 50 of the FB-43-2401 Torroids

For RG-213 or RG-8 size coax:
Use 12 of the FB-43-1024 torroids.

Type 43 material is the stuff you want for VHF work. And Type 73 or
type 77 is the type you want for HF work.

Message-ID: <1994Sep28.112229.49259@ucl.ac.uk>
Source record: 116158

I've written a program for the analysis of Yagi Uda antennas.

TITLE: YagiUda-1.0.tar.Z

PURPOSE: To analyse performance of Yagi-Uda antennas. You
give the dimensions and positions of each element, and the
program calculates gain, input impedance, front-to back ratio,
beam-patterns etc. An optimisation program 'optimise' tries to
optimise a design.

This can be had by anonymous ftp from:

medphys.ucl.ac.uk

username: anonymous
password: your e-mail address.

It in the directory /pub.

Note that the program does *not* presently run under DOS. It only runs on a unix machine. It has been compiled on both a Sun and a PC running unix.

Please feel free to ftp the file if you wish.

The programs are public domain, but I've used a few copy-righted routines for mathematical calculations from the book 'Numerical Recipes in C' by Press et al, Cambridge University Press, (1992). You will need to purchase this book to get the source for these - its *not* included in my distribution.

2827. Help identifying some SMA devices and a circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-09-29 19:17:38 UTC
From: little@iamu.chi.dec.com
Message-ID: <36f3si$7k5@nntpd.lkg.dec.com>
Source record: 116164

I purchased a couple "black boxes" at a recent hamfest and am trying to
figure out what they are. They are built using surface mount devices
and I don't recognize the part numbers. Can anyone help me identify the
following components?

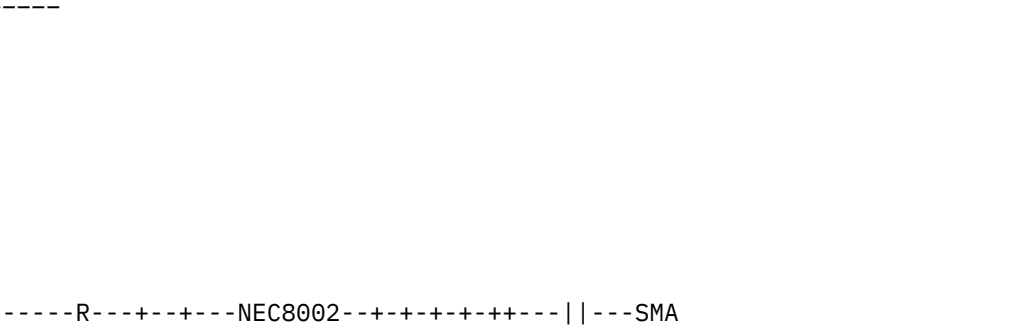
NEC part 8002 - appears to be 3 terminal white ceramic device as follows:

??? part GB 12 - appears to be a 4 terminal black plastic case:

??? part CJs81?? - appears to be a tiny 3 terminal black plastic case
and I'm not certain about the 81, it's written at a
90 degree angle to the CJs and is microscopic in size:

Also, how does one tell chip resistors from chip capacitors? I'm new to
surface mount technology.

My guess is the device is some sort of uhf/microwave amplifier given that
it has an SMA connector on each end and what appear to be two supply
voltages, Vcc and bias? From the SMAs there are coupling capacitors
leading to the NEC device with an apparent feedback loop. So it looks a little
like (if I got the resistors and caps right):



```
| || R R R R R
R Gnd +-+-+-+-+
+---------+---R-+-R-+ |
| C | L
+-GB | CJs |
-- ------R--------+ +------R---------+--- Voltage regulator,etc.
+-12
|
R
|
L---V? a line via a feedthrough cap
```

Why all the resistors in parallel? Current handling?

Any guesses or information would be greatly appreciated before I try
and fire these suckers up and sweep them.

From: Peter Gyorffy <74022.465@CompuServe.COM>
Message-ID: <36gr1d$6mm$1@mhadf.production.compuserve.com>
Source record: 116020

Greetings all

I have an application which requires several transmitters in a limited area, about 10 feet apart. I'd like to set it up so that the ranges of these transmitters do not overlap, and as a receiver moves it will receive from the closest transmitter, and no other. Kind of like cellular but in a room. Cross talk must be avoided.

Any suggestions as to the easiest way to adapt an existing transmitter (eg. RC) to this kind of application?

Or perhaps an FTP source of schematics for something along these lines?

I am GREEN in this area, not even sure what kind of radio band would be best suited to this application. Line of sight is not sufficient.

Thanks in advance for any advice you can provide

This is something that happens to me a lot at work, in computers:
I get told the solution, but not the problem. Why do you want this
system of very short range transmitters and a receiver that will
receive from only one at a time? There may well be a better solution.

Stephen

---------------Cut Here-----------------

DESCRIPTION OF THE 'DIALS' ARCHIVE OF POSTSCRIPT FILES

* *
FILE: dials.readme

The files in this directory are a series of various types of radio
dial plates and dial decals that are useful to the home constructor.
These designs are copyright by Robert D. Keys, NA4G. Permission to
use these for any non-commercial amateur radio or antique radio
purpose is expressly given by the author.

The file collins2.ps is a replacement dial decal for the Collins
R-388/51J type radio receivers. Many of these receivers have very
poor dial drum decals that have flaked away with age. This replacement
dial drum decal can be very easily installed over the original, and it
will not affect the original in any way, if care is taken in the
installation process. To use, affix the top end of the replacement
dial drum decal over the original, careflully aligning it over the
original, as closely as possible, with a small piece of clear mylar
tape, at the sides. Wind the replacement dial drum decal over the
original and affix the bottom end with a long strip of clear mylar
tape. To remove, just carefully cut the tape and the replacement
dial drum decal will roll off. The original Collins dial drum decal
was black and red. My replacement decal is just black, and the type
font style is slightly different from the original. But, it is a
very close match at all the alignment points. The original dial

drum decals are very hard to find, but this replacement is very
nice in appearance, and looks just fine, installed.

The file dials.ps is an assemblage of various kinds of dial decals
and dial plates that I have used over the years. If you find any
of value, you are welcome to use them.

The file et8019a.ps is a replacement dial setting logging card for
an RMCA ET-8019A marine HF CW transmitter. It is useful for any
project that requires a dial setting logging card. Cut to suit
and mount.

The file namdial.ps is another assemblage of various kinds of
dial plates that may be useful. If you find any of value, you
are welcome to use them. Cut to suit and mount.

The file round2.ps is a dial plate patterned after the classic
National and Millen rectangular vernier dials. If you have a need
for a half-round vernier dial plate, then this may be what you need.
Cut and mount behind your vernier dial mechanism on the panel.
You will need a pointer of some kind with the vernier, for it to work
properly.

The file scale100.ps is a linear sliderule dial plate for anyone that
has the temerity to put together an old-fashioned '40s vintage type
sliderule dial mechanism. Xerox it up or down in size, to suit, and
mount on the panel under the sliderule pointer.

Most of these smaller decals or plates can be mounted to a panel with
double stick clear mylar adhesive tape. If you can xerox them onto
two-wide mailing labels, that can also be made to work quite well.
Alternatively, a dab of superglue or spray contact adhesive will also
work quite well. The larger decals or plates can be cut out and
mounted to a panel with screws at the locations of the dot screw holes.

Enjoy....

> with solid metal legs can be resoldered for as long as they hold together :-)

Just to be sure I wouldn't lead anyone astray, I checked with the
surface-mount technology expert here at work about soldering SMT devices.
He said that:

1. Standard tin-lead solder is used universally throughout the industry.
2. Nearly all modern SMT devices are solder-dipped. (i.e. no silver)
3. Of the few SMT devices that do have a silver plating, they add
palladium to the silver to improve solderability. Yes, some of the
plating does leach into the solder, but that only improves the joint.

I suspect the myth of using silver solder started back in the old days,
when chip components were not used on PC boards, but in microcircuits.

Quite often this phenomenon is nothing more than RF energy being
picked up and rectified in the input stage of your meter. The source
could be a nearby commercial AM broadcast transmitter or any
other source whose output varies.... lotsa possibilites.

: Moritz DL5UH

I expect it would. I'm the one who made the original post, and would like to thank all who responded and shared their expertise with me. My solution came in the form of a 2 1/4" diameter ferrite torroid. Placed just below the feed point, I wound 14 turns of my RG58 feedline through it. VSWR was all over the scale with variations in moisture before, and now wavers almost imperceptibly under the same conditions. The torroid cost me US$2 at my local surplus store. The torroid does the trick, and is merely a 'current balun', or 'choke balun', as set forth in the ARRL literature and others. It works well, I can attest!

I was originally concerned about the possibility that the torroid was absorbing power, but am now convinced that isn't the case. The torroid raises the impedance of that particular path (the outside of the coax) at least at the frequency of interest, and so absorbs little to no power.

Thanks again to all who have helped me out. :)

Take care,
Alan

: >being absorbed by the ferrite (ie., wasted power), or is the torroid
: >giving me a high impedance 'choke' -- effectively just closing the door
: >on that rf path? Oh, and the frequency is ~50MHz.

: The energy is not being lost. You are correct in the assumption that the

: choke is "Closing the door on that rf path."
:
: It is my understanding that wrapping the coax around the torroid core
: is not very effective as so little of the cable is in contact with the
: core.
: You might want to try installing a "Current Balun" which consists of many
: torroids just big enough to pass over the cable. I beleive that Amidon
: amoung
: others will sell you the parts or finished units. Since you are
: operating at
: 50 MHz a typical HF balun won't work. You will need to specify that you
: need a balun that will work at 50 MHz. Hope this helps.

: Terry KJ7F
:

You might want to try using a ferrite donut out of an old color TV yoke.
Simply cut the copper wire off the donut. In your case you can wrap the
coax through the donut as many times as it will fit while still remaining
in contact with the ferrite.

I have also used these TV yoke ferrite donuts to eliminate TVI. You can
wrap both the line cord and the antenna coax through them and the TVI
disappears like magic!

Good luck, Mr. Phelps!

2839. Is there a cheap 1200 baud data link out there?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-03 11:50:01 UTC
From: southagr@caedm.et.byu.edu
Message-ID: <southagr.6.009210FB@caedm.et.byu.edu>
Source record: 116031

I am looking for a low cost solution to radio linking low speed serial data. 1200 baud is fine, slower might be ok. I want to transmit from a metering station to an IBM about 1/2 to 2 miles away. I know that running cable would be simpler, but isn't very practical in my case.
I am looking into building my own Tx/Rcv pair, probably with the NE605, or MC3367 Rcvr, and a cookbook Tx, but since my experience is more in digital and less in radio, I'm having trouble rounding up the pieces the app. notes example circuits recomend. Digi-Key, Mouser etc. just don't seem to "do" radio. If someone has built such a pair, or if such is commercially available, I'd like to purchase rather than build. Alternatively, source recomendations (for the coils, filters etc.), proven schematics, advise, etc. would be very helpful.
Also, I've read chunks of CFR 47, and get the impression that 49Mhz would be the easiest freq. to deal with, but I would like to get my hands on a layman's guide to the subject. Does the ARRL publish anything specific to my type of project?
Thanks in advance,
Gordon Southam

>And it was discontinued almost 15 years ago (sigh). One way
>of easily making a synchronous detector might be to have a 4046 pll
>drive a 4066 analog switch.

Unfortunately, my QST and RF Design collection is at home, but sometime during the past 24 months there was an article in QST and another in RF Design (I think) regarding AM syncronous detection. The article in QST used an FM chip such as a CA3089 as a synchronous detector. The individual pieces of these IC's can actually be used for AM type applications. The NE604 has external connections for some of these peices as well. One circuit in the QST article used a seperate PLL (such as the NE564) to generate the carrier and the other just hard limited the incoming signal to generate the carrier.

This article was aimed at detecting the proposed new DSB-SC and SSB-RC Shortwave broadcast signals.

ABSTRACT

This work was presented as a talk to the Homebrew Special Interest Group (HB-SIG) of the Raleigh Amateur Radio Society (RARS), on 15 January, 1991 and was revised for another presentation on 26 January, 1994.

This document contains excerpts of the National Electrical Code (NFPA 70-1990) that, in the author's opinion, apply to the installation of amateur radio equipment as would commonly be found in most amateur radio stations. Direct excerpts from the Code are contained within inset quotations. Paraphrased excerpts from the Code are itemized. The author's interpretation and discussion of the Code is set full-width. The author's interpretation and discussion of various sections of the Code is not meant to be all-encompassing, nor the official interpretation of the National Fire Protection Association, nor of any offical governing body having legal authority of jurisdiction over electrical installations, but is meant to be used as a teaching tool for amateur radio operators.

Robert D. Keys, NA4G

Last time I checked, these consisted of just two 75 ohm resistors.
Yes, this is poor design. Anything goes in the CATV industry these days ;-).

You might want to look in ARRL's 'solid state design'.

: and don't understand some coil phenomena.

: The instrument has an coil of very fine wire (about #44) wound on a hollow
: plastic core, probably >> 5000 turns, about 1.5 inches in diameter.
: Horizontal earth movement causes this coil to move in and out of a strong
: magnet, which generates a changing voltage.

: If I remove the magnet and measure the coil resistance, it shows a rock
: steady 48.1 k ohms.

: With the magnet in place around the coil and with the coil locked so it
: can't move, the coil resistance bounces slowly betwee 47.6k and 48.5k.

I'd say the coil is moving somehow. Try using a small AC source and
measure the current thru it (calculating the resistance). The AC may
help stabilize the coil, and help damp out any tiny little movements.
Is the magnet a permanent type, or an electromagnet? If it's an e-magnet,
then tiny fluctuations in the 'primary' of this 'transformer' will create
large changes in the 'secondary.'

>AL N1AL

Having worked for some years with hybrid circuits, I was ready to rebut Al's statement, since it went against my experience. However, I ran an experiment with some resistors and capacitors intended for PC SMT use, and support his conclusion. I alternately put solder onto the part's end, then removed it with Soder-Wick (tm). I did this using both 63/37 tin/lead solder and then with solder containing 3% silver. After ten applications/removals, the component metallization was still intact, at least to the point that contact could be made with the part.

I had run this test before on components with silver-palladium terminations (for conductive epoxy or solder attachment) and gold terminations (for wire bond attachment), and with pads on alumina hybrid substrate material. In all those cases, 63/37 solder leached the metallization off within a couple of cycles, whereas it took, as I recall, about half a dozen before the metallization disappeared when silver-bearing solder was used. So it isn't entirely an old wives' tale -- it just doesn't apply to modern solder-terminated SMT parts.

Old Tek scopes used to come with a little solder wrapped around one of the legs. This was silver-bearing solder to use when repairing the instrument, to prevent leaching the metallization off the ceramic strips which were used to mount components.

Place-n-Pick mounting. The glue blob goes on the board first. You can
vary the height of the part by the diameter of the glue blob. It's all
N/C machine type operation, so it's fairly easy to specify all sorts of
parameter on each part, and not just the X-Y location.

I'm working on homebrewing a frequency counter around an ICM7216.
The current challenge is finding a good input circuit. For HF,
capacitively coupling into a 74HC gate looks good. For higher
frequencies, I'd like to use a 74F prescaler, which offers questions
of its own. Should I square up the input and boost the input
capacitance with, say, a JFET preamp?

What's your favorite input circuit for frequency counting?

Stephen

That's what I get for writing a message when I'm tired. Boost the input
impedance, Stephen, _impedance_. Obviously high input capacitance is
easy to get but not desirable. Sorry for the error.

Please remember that the original thread was about *re-using* SM parts. The industry uses ordinary tin-lead for assembly, and SMDs are naturally designed with this once-only soldering operation in mind. But re-working of SMD boards and the re-use of parts brings in new considerations.

Here's an extract from the data on a grade of solder recommended for SMD rework (from the British RS catalog):

"LOW MELTING POINT
A grade of solder with composition 62% tin, 36% lead, 2% silver, which exhibits a very sharp (eutectic) melting transition... at 179C. The [low melting point] feature is useful when repairs on fabricated boards are required; by careful temperature control component displacement and thermal damage can be minimized.
The alloy is also exceptional in its wetting/flow capabilities and the silver content also prevents leaching when soldering to silver or gold plated surfaces, thereby preventing embrittlement...
The 24 and 26 swg wire [22 and 24 AWG] is ideal for repair/rework of surface mount boards."

So there are actually *three* features here: the low melting point, the superior wetting properties, and also the avoidance of leaching in those components that are prone to it.

Maybe Al is right: it could well be that the leaching feature is the least important of the three.

In practice the components that give most trouble are chip caps, which are generally the passive components we most want to recycle. I've certainly found that the low-melting silver-bearing solder helps with these - the "superior wetting" claim does seem to be true.

Obviously you need to suck away as much ordinary tin-lead as possible from the joint area first, and clean the bit of the iron before changing solders. Otherwise you're still working with mostly plain tin-lead.

Since the 62/36/2% composition has a uniquely low and sharp melting point, I'm sure it must be available in the USA and in other countries too. But don't just ask for "silver-bearing solder". There's also a grade of tin-lead-silver solder with an exceptionally *high* melting point!

Yo knowlegable hams,
(I must say this as I find my professors totally useless most of the time)

Can anyone out there point me to some good references on Phase Noise?
I have read the three part series on Phase noise in oscillators by
ulrich Rohde in QEX, as well as the chapter on oscillators in Rohde's
book. I guess I might have seen some other work, but I don't recall.
I am mainly curious in finding a good reference on the true effects of
phase noise rather than just "where it comes from and how to eliminate
it".

I think I understand the basics, I just want see some more
writing on the subject. This seems to be one of those things where
you get a different interpretation from everybody you talk to.

thanks much,
-Lance

I'd like to build a directional coupler for VHF and UHF power and SWR measurements. The ARRL Handbook has a project using copper tubing and a 'T' fitting. My Radio Shack SWR meter uses an etched PC board, while another SWR meter uses metal rods in a plastic holder.

Is there any advantage of one over another? Does the PC board version show impedence 'bumps' from being in one plane, as opposed to the copper-tubing version? Will RF radiate from the PC board? It certainly looks like the easiest to make, but is it any good?

Try the section on receiver characteristics in DeVoldere's "Low Band DXing", which is available through the ARRL. Or try this book:

"Communication Receivers, Principes and Design"
by Rohde and Bucher.

Yes, the plumbing construction offers low loss, a definite advantage
if you intend to run high power or don't want to lose receiver sensitivity
by having something lossy in the transmission line.

Here at the HP Santa Clara Division where frequency counters are made,
the normal way of doing that is to use a high speed comparator such as
the AM686 (or its variations). You can use a 10H350 to convert from
ECL to TTL if necessary.

To get high input impedance to use a scope probe, a source follower
is switched in ahead of the comparator. A BF980 or similar makes
a good source follower.

I have uploaded to SimTel, the Coast to Coast Software Repository (tm),
(available by anonymous ftp from the primary mirror site OAK.Oakland.Edu
and its mirrors):

SimTel/msdos/hamradio/
rfmatch6.zip Hams: RF match calculator and optimizer

RF match calculator optimizer is a graphic impedance calculator. The
program can be used to match sources to loads with networks made with
impedances, inductors, capacitors, transmission lines, stubs and trans-
formers. Frequency and components can be trimmed on line and the result
is imediately shown. Frequency sweep and montecarlo simulation can be
used to evaluate the behaviour of the matching network. Autotuning
helps the user to find a solution to matching problems. A pop-up
calculator for complex numbers is also included.

Special requirements: EGA (VGA).

Changes: Frequency sweep with markers.
Licensed version: Mouse control of cursor. Ability to load a
file of start impedances.

rfmatch6.zip has replaced rfmatch5.zip.

I use a 600 ohm mic (Shure SM-58, just like Roger Daltry!!) and I had no
problems running it direct to my TS-820S. I tried a transformer to match
the impedances, and it made ABSOLUTLY NO DIFFERENCE!!

Just plug it in and go for it, Wayne!

```
I want to build a battery charger for deep-cycle (marine) batteries.
I would like this to be the primary power for my gear. Currently
I have a dual band HT and an amp, drawing 7.5 amps (xmit). A
lowband rig would draw 20 amps on xmit. During emergencies
I guess I would run it QRP, but normally I would want to go
full power. We should probably add a laptop for packet, I have
no idea what they consume.

Would the battery be able to power such a setup for hours or days, assuming
standard xmit to receive ratios and the like? Is this a rediculous idea?
Should I buy a 20 or 35 amp power supply and forget the batteries?

If the batteries are feasible I will need a charger. There is
one in the ARRL Handbook (1994) using a 3906 (?) IC. I know
that the various resistor values will change for the voltage and
current loads that the battery needs but what about that
pass transistor? The article even says that it may not be
sensitive enough for heavy loads. Can someone suggest an
alternative transistor or schematic?

Thanks for your input!

>Can the same idea be used with overtone xtals? For example, I would
>like to build a 48MHz IF filter.

>Thanks for any info, Ian

Well, I took this as a personal challenge to find out what's what. I hooked up 3 48MHz microprocessor crystals to the network analyser. These crystals were CTS model MP-480. I measured them at 16 MHz and at 48 MHz for their equivalent circuits. At 16 MHz they showed very good response with about 3 ohms equivalent series resistance and Q over 100,000. At 48 MHz 2 showed good Q of about 160,000 and 15 Ohms equivalent resistance. The third had much better series R of only 9 Ohms, but the Q was considerably less and it was also not a good match for frequency.

I used the design equations from the May 1982 QST article (Hayward) for 2, 3, and 5 element filters. They all showed reasonable calculated values as long as the bandwidth was between 1000 Hz and 3000 Hz. Outside these limits either the capacitors got really small or the load impedance for the filter got really small. In the 2500 to 3000 Hz range the load impedance is high enough that there is minimal insetion loss.

The 2 element filter I built with the 2 good crystals from my parts bin showed good agreement with the formulas when measured on the network analyser.

Digi-Key sells microprocessor crystals for about US $1.35 in this frequecy range or 10 for US $11.00. This is cheap enough to buy a bunch and select for matching.

I hope this gives you encouragement to try this, Ian. Here is a short bibliography of articles which should help if you try to build a filter. I have arranged them in order of the amount of help they were to me:

QST May 1982 pp 21-27
Communications Quarterly Winter 1993 pp 11-18
QST Nov 1980 pp 20-23
QST Jul 1987 pp 24-29

I seem to recall one in an old issue of RF Design but I haven't had time to look for it.

2873. Re: Homebrew Antennas for cordless phones

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-07 07:59:54 UTC
From: laforest.snowcrest.net
Message-ID: <laforest.snowcrest.net-0710940056230001@ppp0.mtshasta.snowcrest.net>
Source record: 116063

Does anyone know if the range of cordless phones can be extended by adding a long wire to the end of the antenna?

This digitial cordless phone uses 900 mhertz frequency... and should the antenna be any particular length to optimize its effectiveness?

I'm wondering because I heard that digital cordless phones might have up to 4 times the range of standard cordless phones...(700' max), ... so I'm wondering if a 1/2 mile range is possible?

thanks

Hello Friend Hams.....

I have just purchased a HAL CRI-200 Computer RTTY Interface and am
looking to find some information on same.

1. Does anyone have a manual that I could get a xerox of?

2. What is the power voltage and polarity required at the dc power
adapter socket on the back panel (+12vdc? GND=SHELL?).

3. What is the pinout and interface specifications on the 5 pin
computer I/O port connector? I am assuming RS-232, but it could
be something funky like 5V tty RS-232, or it might even be current
loop (20 ma).

4. What are the cw keying polarities on the two keying jacks?
Any Help is appreciated

Most Sincerely,
Robert D. Keys, ``Boatanchor Bob'', NA4G
rdkeys@csemail.cropsci.ncsu.edu

>chips. Thank you in advance for helping out, Jacques.

Jaques:

You can get the chips you want through Digi-Key but they won't help
you any. The problem is that they are bipolar PROM's. You will need
a copy of the service manual which hopefully lists the program for the
chips. Perhaps Atlas is still in business and you can get either the
already programmed version or they can supply the bit pattern for the
parts.

If you get the bit pattern and the parts I can burn the PROM's for you
or perhaps someone locally can do it for you.

[ Instructions for retrieving 'batterie.ps' are at the bottom of
this message. ]
******************************************************************************

The following article (batterie.ps) is a short article about batteries
and battery charging. It covers many types of batteries that amateurs
might find useful around the hamshack. It does not cover small HT
style batteries, although the principles would be similar.

Most of the batteries that I use are from the local scrapyard, and
were junked from industrial lighting systems, etc. I can usually
get a couple of years of service out of almost any of them, with
a little care, and some thought about bringing them back up to snuff.

There's an error in batterie.zip at the second site. The copy at the first site is fine.

Well, there is a daily and 3-day digest available via ftp:
ftp sunsite.unc.edu then
cd pub/academic/agriculture/agronomy
then do a `dir' and look for DAILY.QRP and `get' it.

2887. Biasing tetrode tube - affects gain?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-08 03:09:29 UTC
From: dgf@netcom.com
Message-ID: <dgfCxC3Ft.Gs2@netcom.com>
Source record: 116077

I'm slowly progressing on a passive grid driven 4-1000 amp. I can either bias it as a regular tetrode per eimac specs (some screen voltage and some grid voltage as appropriate), or bias it as if it were going to be run like a grounded grid triode (ground the screen, DC ground the control grid, and AC ground the cathode, with a few volts of zener bias in the cathode DC path as would be done for grounded grid).

Anyway, it seems like it would be much simpler to use the grounded-grid style biasing (remember, the tube would still be grid driven, so it is _not_ a regular grounded grid circuit).

Would these two approaches yield different gain in the amplifier, all other things (AC circuit parameters) being equal? I want to take the passive grid driven approach to (1) avoid the tuned input needed for a grounded grid amp, and (2) reduce drive requirements to about 50W for full output.

Thanks for any insights!

2889. Fractional turns on toroids?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-09 01:06:03 UTC
From: Mike.Czuhajewski@hambbs.wb3ffv.ampr.org
Message-ID: <1994Oct08.210603.16886@wb3ffv.wb3ffv.ampr.org>
Source record: 116078

The June 1994 issue of QST had an article, "Inexpensive Interference Filters", where the author specified fractional turns on toroidal cores. (Specifically, he gave tap points at fractional turns.) I was always under the impression that the general rule of thumb was to count one turn through the center of a toroid as a turn, and not to worry about fractional turns. Indeed, several carefully controlled experiments with relatively large cores (1" and up) over several sessions, on a Boonton 260A Q meter, gave thoroughly inconclusive results. Sometimes the addition of a fractional turn gave an increase in inductance (slight), sometimes no difference, and sometimes--I swear this is true--it even indicated a slight reduction. These tests were done with fairly similar methodology, but over a period of time and with a variety of cores. I did not document them thoroughly, but may repeat them in the future. (And yes, I did try as hard as possible to freeze all turns in place with Q dope, keep leads from the coils to the fixturing as rigid and unmovable as possible, etc.) Has anyone experimented, under closely controlled conditions, with fractional turns on toroids and proven whether or not they are worth worrying about? (As the author himself admits in the text, and as many homebrewers have known and proven over the years, "the coils inductance won't always be exact because of variations in core permeability and winding technique.") 73 de WA8MCQ

Can a square wave oscillator, such as the oscillator in a 4046 pll be used either as a bfo or vfo?

If not, is this because of the many harmonics generated by a square wave?

Specifically I'm trying to build a direct conversion receiver using the 4046 and a 1596 mixer.

Yep, I believe that will work WELL. There has been some discussion
about how square wave LO's work better than sinewave LO's. I don't
know the whole reasoning behind it, but it has something to do with
the very short rise/fall times as compared to sinewave LO's.
Apparently, these edges are where a great deal of IMD products are
generated (makes sense if you think about it).

anyway... go for it. THere is one version of the 4046... that
goes to 12 MHz or so, its the 74hc4046 or something like that...

Diode ring mixers work *best* with high level squarewave drive. The
diodes are shifted through their non-linear region quickly which produces
fewer distortion products. The harmonics of a squarewave are all the
odd order products starting with the 3rd harmonic of the fundamental.
That puts them far enough away that a relatively simple post-mixer
filter can handle them.

The 1596, though is an easily crunched mixer. It doesn't like high
level drive. You might be better served with a diode ring mixer.

: The June 1994 issue of QST had an article, "Inexpensive Interference
: Filters", where the author specified fractional turns on toroidal
: cores. (Specifically, he gave tap points at fractional turns.) ...

Since I was the author of the article, I'll answer the question.

I don't have the article in front of me, but I don't recall listing
fractional turns for the main windings. I agree that it is not possible
to achieve a fractional turn: So long as the two wire ends are connected
through the rest of the circuit, the turn is effectively completed anyway.

I did list fractional turns for the coil tap points. You can think of
the tapped coils as RF autotransformers. The exact tap location
definitely affects the impedance ratio.

I have used you idea for about 3 years now and it has worked fine.
My HF rig draws about 20 amps when in tx. I run my packet station
from this source also.

I have a voltmeter at the desk to monitor the battery condition.
I have never seen it below 12V. The battery I use is a deep cycle
Gel-cell. The charge is maintained by the "Battery Watch Dog"
charger described in the ARRL handbook. It can be left hooked to the
battery permanently. It will not overcharge the battery.
The apporox 1.5 amp charge rate seems to be sufficient.

This is being posted for a friend. I can answer as many questions as
I know the answers for, via E-mail.

For Sale

K-Band Radar *GUN* unit.

Operates on 24Ghz
(Some may be tempted to alter the radio to work in the ham-band, this
is why this has been cross posted to .homebrew and .equipment)
Runs off 12VDC (Comes with 12VDC Cigarette Lighter Plug)

This has been advertised on various newsgroups before, but the seller
lost their net access along with all prospective purchasers.

(2 or 3 were interested and bidding)

Their addresses have been lost along with the mailbox of the account
which was nuked.

If you are interested, simply reply here. I'm helping my friend sell
this unit.

*** Possible Items for Trade or Trade w/Cash ***

-Mobile scanner with 46mhz, VHF, UHF, 800 including Cel Tel, Etc.
-Dual Band 2m/440 Mobile radio with detachable faceplate.

*** Asking Price ***

$250 Cash (Repair shop lists this unit at $500)

Purchaser pays all s&h, No COD's.
^
^- Thus purchaser chooses options of shipper, insurance, etc.

"I've used this unit various times to clock different targets. It has
come in very handy for a friend who was clocking his high performace
car at the track. "

(You could acctually clock cars at a race with this if you bought an
easy to carry 12vdc power source)

*** All interested replies ***

Direct your replies to me via e-mail at:

br260@po.cwru.edu

If you have problems with the above address, you can send mail to:

root@b63062.cwru.edu (ONLY if the above address does not work)

If sending mail to the root address, make the subject of your
mail state: Pass this on to the old 'jbourne'

Thanks!

2904. More on Using 49MHz for Data

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-10 14:49:11 UTC
From: mack@mails.imed.COM
Message-ID: <9409107818.AA781804774@mails.imed.com>
Source record: 116106

Gentlemen:

Now that we have the specs out in the group (thanks much) it is
easier to design a solution for the requestor.

It appears to me that Part 15 ONLY applies to the transmitter part
of the setup. Therefor, it is possible to greatly increase the range
by using a directional gain antenna.

My proposed solution is this:

1) build the transmitter to take advantage of the 100mW limit.
2) build a short loaded horizontally polarized dipole.
3) build (or buy) a 4 to 5 element Yagi. This should give about
10 db of gain and has the additional benefit of rejecting most
of the signals from other users of the band. It is possible to
buy a 6M beam and just tune it down to 49 MHz.

Remenber that Part 15 devices must ACCEPT all interference they may
encounter.

Source record: 116097
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I friend of mine has a dead Yaesu FT-747 HF transceiver that was damaged in shipment (UPS). I have not seen the radio but I was told that the top was slightly dented and the front panel looks like someone removed it with a crowbar. The basic radio carcass looks to be in reasonable shape but the front panel is pretty much a gonner. Yaesu wants over $400 to repair it.

Fortunately it was insured. UPS paid the claim and returned the dead radio.

Anybody want it? Probably has lots of good parts. Make an offer.
I will pass the info along.

>I want to build a battery charger for deep-cycle (marine) batteries.

Dear Steve
Do you want a battery cahrger or do you want to build one? For
a charger you don't need a regulated supply, just something that shuts
off at 13.5V or so. YOu can do this with a regular charger from anywhere,
by putting an SCR in the output. Connect the anode of the SCR to the old
output, the cathode of the SCR to the output, put a 14V zener from the
gate to earth and a 5k resistor from the anode to the gate. WHen the
battery goes above about 13V the SCR shuts off. Joe Mack NA3T, mack@ncifcrf.gov

2908. Help with Plotter

Newsgroup: rec.radio.amateur.homebrew

From: dshalita@rogue.COM
Message-ID: <m0quPqi-000EmEC@rogue.com>
Source record: 116100

I was recently given an old HP-7475A Pen Plotter, to use, if
I could, for small homebrew printed circuit boards. This plotter
has an HP-IB interface and my PADS shareware IBM PC386 can only
drive plotters thru the RS-232C serial port. This plotter was on
an old Commodore Business Computer System.

I'm looking for any low cost solutions to my problem. Any suggestions?
I don't know if a used IEEE-488 card in my PC386 would solve anything?

Can't put a lot of money into this unit. I need to know if I have:
1. A working PLotter.
Yes it does complete the self test image.
2. My software(s) can really produce artwork with it.

Thanks and 73 de Dave, W6MIK

2909. Suggestions on Lemon Powered QRP rig

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-10 20:38:56 UTC
From: w4qo@peach.america.net
Message-ID: <w4qo.781821419@atl1>
Source record: 116096

I posted this in the qrp mailing list the other day and have had some
good responses. Any ideas?

I am helping a high school student - KC4ROW - do some work with various
"fruit" and "vegetable" batteries for a science fair project. We both
feel that it would enhance the exhibit part of the project to have a
Lemon Powered QSO. We can build up a little milli-watt rig such as the
fine article on page 18 of QST, March 1992, but what I'm looking for are
suggestions on a receiver we can use. Here are some discussion items:

1. A DC receiver that draws less than 10 ma, is there one? I think we can
generate 10 ma from a lemon juice battery. We can use an external audio
amp on "commerical" power.
2. A crystal set - Ok we could use an "external BFO", IE another
transmitter offset by 500 hz hidden nearby. Kinda seems like cheating
though, but we could power it from a lemon too.
3. An R-390 powered by an inverter and 3,000,000 lemons for 11 seconds!

Any ideas appreciated. I have quite a large supply of QRP magazines for
the past 5 years so you could refer me to one of those. Also, maybe we
could have some kind of "Lemon juice" challenge for the farthest QSO on
say 40 meters using only two lemons as power.

2910. Using a 74HC4046 be used for an LO in a receiver?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-11 00:00:17 UTC
From: ka7oei@uugate.wa7slg.ampr.ORG
Message-ID: <18239@uugate.wa7slg.ampr.org>
Source record: 116103

I'm not sure that I would want to use the VCO in a 74HC4046 in a receiver
if you run it higher than several hundred KHz...

You'll likely have to be very careful to watch the phase noise of the oscillator
when you get into the MHz area... Much of it may depend on the loop bandwidth
and its possibly inherent ability to suppress that sort of noise. It all
depends on your particular application.

If you are over several hundred KHz, you may want to build a varactor-tuned
VCO and use the phase/frequency detect portion of the chip for that.

One possible lineup is to use a VCO, followed by a driver (to generate
a squarewave) to dump into, say, a 74HC4059 (as the divide-by-n) and
use the phase/frequency detector.

This sort of scheme will work well for frequencies up to about 10 MHz or
so with step sizes of 1 KHz or so. If you wanted smaller steps, you would
likely need a more complicated scheme... There are actually many possible
options...

As it turns out, a VCO on the 4046 is not particularly "phase quiet" at
higher frequencies... If you application is insensitive to phase noise
(i.e. some sort of simple, wide-bandwidth receiver) then it may be just fine.
If you need to have low incidental FM and/or narrow bandwidth, then the
phase noise issue becomes important...

Source record: 116101

And let me put in my vote for a Boonton 260A Q meter; I have a pair, and they are neat items...and quite expensive thirty years ago. You may occasionally see one at a hamfest; I wouldn't pay anything over (or anywhere near) $100. I was lucky--I paid $20 for the more expensive of my two, and both work perfectly. Pitfalls: it uses a thermocouple to drive one of the meters, and if that is burned out it seriously reduces the value of the instrument, although there are ways of working around that. Also, although most of the tubes are 7 and 9 pin miniatures, the detector tube is one of the old style with 6 pins--two fat, 4 skinny, and a grid cap on top. It's basically a 2A6, although Boonton sold special versions with their own part number on it. If that's bad, replacement could be a problem, although you could design some other detector circuit. One final note--there are many different Boonton Q meters out there; for something to cover the HF spectrum, the 260A is the latest model. There are earlier versions such as the 100A and 160A, and there is also one (or more?) VHF versions; I have the 190A, covering 20-260 MHz. The 260A covers 50 KHz to 50 MHz and is quite useful for measuring coils typically used at HF. 73 DE WA8MCQ

Steve, you can use two (or three or four) Mini-Circuits switches in series to get whatever isolation you want. Only tradeoffs are price and the additional insertion loss. I have constructed 10nS pulse modulators like this with great on/off ratios.

Jim,

I have to dissapoint you in saying that there is not such a thing as lemmon
power. In the system you want to demonstrate the power comes from the
electrodes dissolving in the poor fruit, which is being abused as electro-
lyte.

Ever wondered why Nicads are not called potassium-hydroxides?

These "lemmon powered" demos only contribute to confusion
and should be dropped quietly.

Quite seriously, Moritz

About 10 years ago in a UK magazine there was a VFO based on a
VCO (for any amateur band) and a crystal oscillator about 500 kc
off the desired band. The frequency difference was phase locked
to a vfo tuned by a 500 pf max variable capacitor around 500 kc.

: Elec. several years ago. This meter works great for measuring capacitance
: but just doesn't get it for measuring small inductances (uh range).

I'm surprised nobody has mentioned the trusty old dip meter method.
A (grid) dip meter is an oscillator with an exposed oscillator coil.
When you bring the coil close to the inductor of a tuned circuit,
the meter "dips" when the tuned circuit is tuned to the frequency
of the dip oscillator. (Or the oscillator is tuned to the frequency
of the tuned circuit.)

To measure a small inductance, connect it in parallel with a known
capacitance to form a tuned circuit. Measure the resonant frequency
with the dip meter and apply the formula:

L = 1 / [C (2 PI F)^2]

Where L is inductance (H), C is capacitance (F), PI = 3.14159, and
F is frequency (Hz). The formula also holds for uH, uF and MHz.

The neat thing about this method is that you can mount the coil in
the actual circuit, so stray capacitance and lead inductance are
all accounted for.

The coffee-can type filters work pretty well for receiving, but they're too lossy to use for transmitting. A friend of mine brought a six meter version into work the other day and we hooked it up to a $30k HP impedance analyzer just to see what it was REALLY doing. It had a nice sharp peak at 50 MHz just as advertised, but you should have seen the look on his face when he realized it had a 3db insertion loss. This means that half the power through it was lost as heat. Good thing he wasn't running a KW - would have kept the room nice and warm!

The problem of course is that there is a very large amount of circulating tank current in the device. Had it been silver-plated, it probably would have been ok. If you still want to try one for six meters, email me and I'll get you the dimensions. For other bands you could scale it up or down, but at higher freqs, the loss will be even higher due to increasd skin effect.

For inductances in the range of .1 to 300 uHy, an old Tektronix model
130 is hard to beat, but also hard to find. They have been out of
production for years, but they show up from time to time. I finally
found one last year at a hamfest for $40 in perfect working order.
Would've paid two or three times that much if I had to. Great 'ol
timer.

>73 Dave WB0GAZ dgf@netcom.com
>

Well, I see one major problem. Any tetrode is not going to conduct much
if at all until there is the proper voltage difference (usually several
hundred volts) between the screen and the cathode. If the screen is
grounded, then the cathode must be several hundred volts negative with
respect to ground. This is what happens when you connect a tetrode in
"grounded grid" (both grids grounded) and drive the cathode. If you
connect the screen to ground, control grid to DC ground, put a few volts
bias on the cathode and then try to drive the control grid, you're
probably going to ruin the control grid. You just won't be able to
drive it hard enough without the screen-cathode differential voltage.
All that will happen is that control grid current will flow and that's
it - little or no plate current because of the missing screen. Make
sense?

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

FLEA all SUMMER at MIT
October 16th, 1994
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $2 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

!! RAIN or SHINE !! Have no fear of rain, a covered
tailgate area is available for all sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)

You are missing my point here. If somoene put a piece of zinc and a piece
of copper into a glass of water and showed the effect of adding some
salt it would be much more instructive.

It is the phrase "lemmon power" itself that is the gimmik.

Apparently non-metals are getting a bad rap in the battery world.

For the sake of political correctness, perhaps we should rename
NiCads: transition metal/alkaline hydroxide power units,
dry cells: transition metal/alkaline chloride power units,
lead acid: heavy metal/inorganic acid power units, and ...
lemon power: transition metal/organic acid power units.

The loss for a given filter topology is a function of the ratio between
the unloaded and loaded Qs. Thus, you can reduce the loss to acceptable
levels by increasing the bandwidth of a bandpass filter (I assume by a
"sharp peak" you are talking about a BPF). This is why inductor/capacitor
input circuits can sometimes do as well as expensive cavity input circuits
on preamps--sometimes you can lower the loaded Q enough to compensate for
the lossier parts while still getting the required impedance transformation.

: The problem of course is that there is a very large amount of

Silver plating tends to be over-rated. To reduce the loss from 3 dB to
1 dB (still a lot of heat at the kW level), you would have to improve
the unloaded Q by by a factor of 2.7. I doubt that silver plating would
improve a tin plated can that much. My guess is that you would be
lucky to get a 20% improvement in Q. Of course, silver plated cavities
look a lot nicer than unplated copper ones--a big factor if you are
trying so *sell* something.

Hi

The following was previously posted to rec.music.makers.guitar.

I am in the process of performing a service on my mid 60's Fender Princeton guitar amplifier.

I have been having trouble locating sources for the valves [tubes] & high value (450V) electrolytic capacitors. Can anyone recommend places to get these parts, prefereably in the UK? I have got the parts I need on order, but with hindsight I should have spent a bit more time calling around. I'll be using new Fender valves - I wont admit to how much these things have cost me .... I was in hurry ....

I dont read this newsgroup, so any email responses gratefully received. I'll collate & repost any pertinent information.

Regards, Adrian

2941. pin diode attenuators & AGC

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-12 20:14:37 UTC
From: kirkland@bgtys22.bnr.ca
Message-ID: <37hg3d$4n6@bmerha64.bnr.ca>
Source record: 115971

Does anyone have any suggestions on building pin diode
attentuators @ 9 MHz. My interest is in building an
IF stage with pin diode attenuators for AGC and I have been
thinking about using the MAR or MAV series of amplifiers for
the amplifier chain. I know that this might be over kill when
you could use MC1350's or dual gate mosfets but the MC1350's are
only rated 0 - 70 deg C and dual gate mosfets seem to be extremely
hard to obtain and once a source is found relatively expensive.

What else is done for IF amps and AGC?
(I also know about the Plessey series of devices - they too are not cheap
Does anyone know of a source for Plessay in the states that is willing
to supply in the usual small quantities)

Bill Kirkland

p.s. I am presently playing around with the high performance AGC circuit
described in Solid State Design for the Radio Amateur and in
countless ARRL handbooks that uses the now unattainable Motorola I.C.

Off the subject slightly, but you CAN get fractional turns. Though theoretically possible at any frequency, it's practically limited to frequencies where laminated or tape-wound cores are used. Drill a hole through the core and run one turn through it so that that turn only links part of the flux in the core. Voila, a partial turn.

It's a real drag trying to drill a hole in ferrite, though. ;)

Yeah, it's kind of lame.

> Robert
>

The simple and obvious answer is: just use a 7812. This is a 3-terminal regulator chip. But, given the voltage of your transformer further analysis is needed. A 7812 requires about 2 volts or more across it to work properly. There are low dropout regulators that require .6 to 1 volt across them (unfortunately I don't know what's available). The voltage drop across the rectifiers can be reduced by using Schottky diodes instead of silicon diodes.

Measure the open circuit voltage of the transformer secondary. Put rated load on the secondary (use power resistors and/or lamps) and measure the voltage. Post the results as well as the maximum current you want to draw. I or someone else will then be able to tell if it is possible for you to get what you want with the transformer you have and how best to get it.

While it is possible to design and build a discrete voltage regulator circuit it is so much easier to use a chip.

There are some excellent ones in the 1989 Motorola
"TELECOMMUNICATIONS" data book starting on page 2-44 using their MC3362
Low Power Dual Conversion FM Receiver chip. It was made specifically
for that purpose. You can also use their MC3363 chip, which includes a
RF Amplifier stage. They are beautiful and easy to work with.

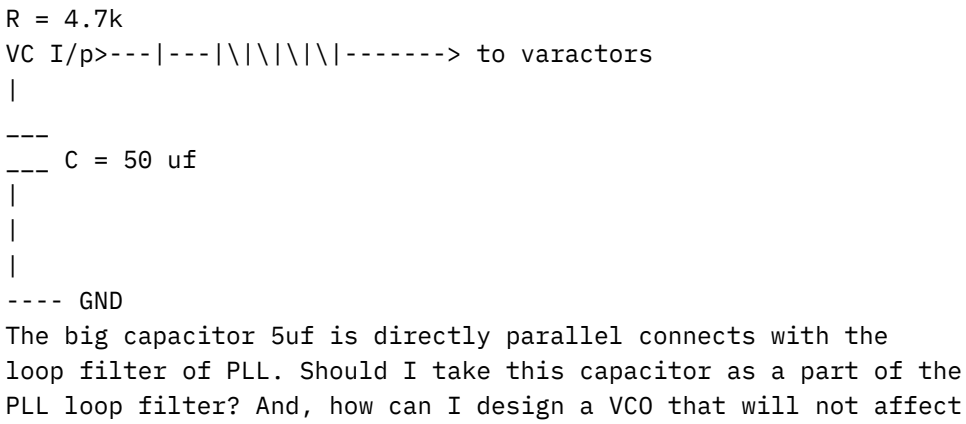
I have a question on VCO design : the resistor and
capacitor of voltage control input, normally for filtering
out the noise ,seems to change the PLL characteristics.
for example, a vc input as follows



The big capacitor 5uf is directly parallel connects with the
loop filter of PLL. Should I take this capacitor as a part of the
PLL loop filter? And, how can I design a VCO that will not affect
the PLL performance ?

I have a grey toroid marked 34 am 55206 - a2 +2, outside dia .75, inside dia 9/16".

From the ARRL handbook, it looks like it might be a T-80-3 ???

Are the color codes standard for toroids?

Is there a color code for ferrite toroid mix types?

2948. balun construction

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-13 14:40:02 UTC
From: jms@col.hp.com
Message-ID: <37jgs2$kbl@hp-col.col.hp.com>
Source record: 115979

I want to construct a balun, for a receiver, 50 ohms unbalanced
to 200 ohms balanced, covering the frequency range of .5 to 33 MHz.
All the toroid cores I've found (Amidon) don't seem to cover that
wide of a frequency range. Does anyone have any ideas how to go
about such a task? Should I just select the closest toroid core
and accept the losses when I use it out of it's frequency range?

Any suggestion and help are appreciated.

greetings,

I regularly use Teledyne brand T0-5 sized relays, DPDT.
These are small PC mount relays, that are characterized
to 1GHz. Certain varieties are TTL interface compatible.
They are fairly easy to use, and cost about $20 each.
Body size is T0-5 (dimensions approx. .370" x .275" for
case).

I use these relays for applications other than what would
be termed "RF", but they are pretty good relays in my
humble opinion. Manufacturer claims they are excellent
for RF applications.

-pat jorden, (these are my opinions, and not necessarily
those of my employer...etc. etc.)

Teh, If you have the Maplin catalogue then you will find that you can mail order by modem with amex or visa. Maplin deal with overseas mail orders so they should accept your order by Cashtel (Computer Aided SHopping by TELephone). If you need more info then let me know. Not exactly Internet but if you don't mind a long distance phone call then it may be a way of getting what you want.

: the PLL performance ?

Yes, the cap will be part of the filter. There really shouldn't be a need for it. About the only filtering you need at the varactor control input would be to take out RF (keep RF from getting back into the active elements feeding the control input), and a 5uF or 50uF (aluminum electrolytic or tantalum) isn't going to be a particularly good RF filter anyway.

As for that last question, it's a little like asking how to design a car with wheels that won't affect the performance. The VCO is an integral part of the loop, and its transfer function must be accounted for in evaluating the whole loop. Even if it's response is very fast, you must at least take into account its "gain": so many kHz/volt. And you better insure its response is fast enough that where it starts to roll off is above the unity-gain frequency around the loop if you want to even think about ignoring its frequency response characteristics.

You can get greatly improved off-isolation performance and no degradation of on-resistance by using two diodes. Follow the series diode with a shunt diode. Turn one on when the other is off, and vice-versa.

Hi Fred, your 5 or 50 uF cap is probably an electrolytic and not good
at decoupling RF. Parallel that cap with a 0.1 uF ceramic. 4.7k seems
low for the resistor, I usually use 100k or an RF choke.

>Are the color codes standard for toroids?

>Is there a color code for ferrite toroid mix types?

To my knowledge, there's no standard color coding for ferrites. Most are unpainted, so are the gray color of the ferrite itself. Others are painted. I've seen gray-painted cores which are ferrite and others which are low-frequency powdered iron. I'm assuming yours is painted, so I don't know of any way to determine what it is except by putting a small number of turns on the core and measuring its impedance at a number of frequencies. If you have one you can sacrifice, you can break it. (Wear safety glasses.) Ferrite breaks like glass, while powdered iron doesn't. If it's ferrite, you can get a general idea of the type by measuring the DC resistivity of the core. (High-freq. ferrites have high resistivity, low-freq. ferrites have relatively low resistivity.) All powdered-iron cores I'm familiar with look like insulators at DC.

The powdered-iron cores made by Micrometals (and sold by Amidon and others) do have a standard color code, but other cores may resemble them.

>about such a task? Should I just select the closest toroid core
>and accept the losses when I use it out of it's frequency range?

The "frequency ranges" usually given for ferrites are ranges appropriate for using them as inductors. At the given ranges, inductor Q will be reasonable. Above the stated range, the impedance remains high but becomes resistive. Typical "low-frequency" ferrites exhibit a relatively constant impedance over several decades of frequency above the "recommended" range. This is not a problem, and in fact has advantages, for untuned transformers. In a properly designed transformer, the winding impedance is high and it's not important whether the impedance is resistive or reactive. Therefore, "low-frequency" ferrites are ideal for use as baluns and other untuned transformers. 70-series is best for the HF range, 43 best at 6 meters, and type 61 for higher frequencies. The exception is when very high power is involved. If the power level is 1 kW and the core loss is 5%, you have an insignificant attenuation of your signal but the core has to dissipate 50 watts of power. In this case, it would be better to use type 43 or even 61 at HF, but it'll be harder to achieve enough impedance, especially with type 61. (Type numbers are Fair-Rite Corp. designations. Other companies have equivalent types with different designations.)

Of course, I/we recognize that it is not the lemon that powers the radio. The whole idea of the project is to use different electrolytes and electrode materials to generate electricity. Also, the difference between a science fair project and pure research is that we try to have fun with science and also to make an eye catching display. That is why my ham radio student wants to conduct a radio transmission and reception using some "odd" batteries.

What I am looking for is a very low powered receiver circuit to match up with the transmitter from the original QST article that I mentioned. Any help appreciated.

If I'm not mistaken, what Robert wants is to get about as much of regulated
juice out of his transformer (which is 12 A). And a 7812 cannot do this alone;
max current limit for that one is 1A. (By the way, this doesn't mean short-
circuit current, I think.) While I know there is a 5A version of 7812
(something like 78T12 or 78K12 - gotta go home and search my junkbox), not
sure if a 10A version is out there. (Yes, I've seen 10A version of 7805, but
there is a hugh difference between 10A X 5V = 50 W and 10A X 12V = 120W.)
Maybe that's why I haven't seen any commercial power supplys made of these
regulator ICs (besides the cost thing).
The number of pass transistors are decided by several factors:

1. Voltage drop across the transistor
2. maximum supply current
3. maximum junction (?) temperature of the transistors used
etc..
As a rule of thumb, one 2N3055 can handle about 5A of current when well heat-sinked for 17V in - 12V out regulator circuit. But then again, this also depends on the size of the heatsink (or, to be precize, thermal resistance of the heatsink).
The chapter on power supply from ARRL handbook will serve a good starting point, Robert; go to your library and see if there are any other books on power supplies (linear, switching, etc).
I am also working on a 12V 10A power supply myself. I wanted to use three 2N3055s for the project (better be safe than sorry), but alas, had only two heatsinks...

2966. Suggestions for my power distribution system?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-14 03:30:17 UTC
From: finster@zeus.fasttax.com
Message-ID: <finster.345.2E9DFB49@zeus.fasttax.com>
Source record: 116015

I posted this to rec.radio.amateur.equipment and didn't get much response. After consideration, that may have been the wrong group, and this one appears more on target. My apologies if you've seen this over there and don't want to read it again. I understand I should have cross-posted it in the first place.

==========

I'm setting up a ham shack here in my apartment and I'm looking for suggestions. Currently I'm using (well, listening for now... still checking the mailbox every day for my ticket) a HTX-202 and an Icom 4AT for radios, along with a couple scanners. I have a two large (larger than car battery, about the size of semi-tractor battery) 12 volt gel-cell batteries and want to use them in my power system. (got 'em for free, might as well use em...) My current plan runs something like this:

Hook both gel-cells up in parallel, and trickle charge them from solar cells. Then run the output from the batteries up to a power distribution center (large project box) with a central amp and volt meter on the main line to monitor the battery state. I plan to have 4 or 5 outputs on the project box. The current plan is to use some Radio Shack "universal voltage adapters" to regulate the voltage on the output. I've found the cigarette lighter type at swap meets for a couple bucks each. That way I can switch the voltage between 3, 6, 9, and 12 volts at each output, and toggle the polarity by changing the end plug. I'm not sure how much current draw those adapters will stand, even though they are the "high-power" type, and are vented for cooling.

My thought was by using a system like this, I could kill any AC hum in the system. Also, I could easily stay on the air when the power goes out.

I do have a few questions:

The batteries have no markings at all. All I know is that they are 12 volt, they will take a charge when I charge them up with my 10 amp car battery charger, and they weigh a ton. (ok, about 75 or 80 pounds each.) Any ideas on what sort of current draw they will stand, and what sort of battery life I can expect? These were discarded from a UPS system because they reportedly "wouldn't take a full charge". After charging with my battery charger, they measure right at 12 volts on my dinky voltmeter, under no load.

If I can get a bank of solar cells together that would put out 12+ volts at a trickle charge (100 - 200 milliamp) will I hurt the battery by leaving it hooked up all the time?

Do I need diodes in-line with the solar cells to prevent the batteries from leaking voltage back through the solar cells?

Is my solar-cell idea just a fantasy?

Assuming my solar-cell idea is a fantasy, anyone have useful schematics for a trickle charger I can build pretty cheap?

I thought it would be useful to have the main volt and amp meters switchable so that I could monitor the main line for total current draw and voltage, or monitor each output alone. I think it would be too expensive (though impressive!) to have seperate meters for the main and all outputs. The problem I see is that switching the meters in and out of circuit would disrupt power to the outputs while switching. Any suggestions to solve this problem?

I plan to place fuses inline with each output. Any suggestions on type of fuses, or are there small circuit breakers that would do the job properly?

Any hidden grounding problems with the above setup that might bite me? I'm currently running from a homemade folded dipole, and a 5/8 wave mag-mount antenna, so the whole setup is floating with no earth ground at all. Should I be concerned with it?

I know someone out there must have a similar setup. Any comments or hindsight observations? I apologise in advance if these seem to be trivial questions and a waste of bandwidth. But then, at least I'm not bitching about for-sale ads and such... :-) I'm not an EE but I'm pretty handy with a soldering iron, at least when dealing with digital systems. I'm learning and reading as much as possible about analog and RF stuff, but I haven't seen this topic covered in the books I have. I've never built a power system before, so any feedback or pointers to other good books would be helpful. I'd far rather buy books and parts and build it myself, even if it ends up costing the same as an "off-the-shelf" system. At least I end up learning something in the process, and know how to fix it when it breaks.

>max current limit for that one is 1A.

A friend of mine suggested the following "quick and dirty" method,
which was used in the company he works:

Use the required number of 7812 in parallel, each fused with just
over 1 Amp. (in this case 12).
How it works? they have the 1 Amp current limit, and when one (the one
with the lowest output voltage) gives 1 Amp, the next one taks over
and so forth. If one fails shortcircuit it will blow its fuse, when you
have a Zener paralell with the output. This is a great advantage over
the 2x 2N3055 method. BTW, There are nowdays transistors about as
cheap as the 3055, (2N3772?) but much better.

Any suggestions?Moritz DL5UH

2970. RF Switches Anyone?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-14 17:15:47 UTC
From: kevinpu@atm.COM
Message-ID: <9410141711.AA20479@atm.com>
Source record: 116005

I posted this to the QRP list but didn't get a response:

In the NEQRP club 40/40 circuit NN1G used a diode bridge (which looks
biased in the middle power rail and ground) for QSK switching.

This circuit doesn't have any LC so its is wide band.

However I have not figured out its mode of operation. I presume it use the
RF from the TX to switch the diodes off on TX whereas the DC bias turns
them on on RX. The TX port is connected to the TX PA and the antenna.

Anyone care to clarify this one for me?

The "V" is a diode with + end (anode) down

```
12 volts
|
R about 1k
|
----------
| |
T V V
X | |
--||-- + +--------||----- to RX
| |
V V
| |
----------
|
R about 1K
|
gnd
```

After a weekend and some though I came up with the following explaination:

Marking up the DC voltages on this circuit:

```
> 12 volts @ 5mA
> |
> R about 1k
> |
> 6.7v ---------- 6.7v
> | |
>T V V
>X | |
>--||-- + 6.0v +--------||----- to RX
> | |
```

> V V
> | |
> 5.3v ---------- 5.3v
> |
> R about 1K
> |
> gnd

All diodes are biased on with about 2.6mA flowing through each diode.

So it seems that when the TX voltage rises to exceed plus or minus 0.6V alternate sets of diodes (A and B) are turned off, the remaining diodes are biased on.

In the above example if the input RF voltage exceeds 0.6V the diodes A are turned off and the diodes B remain in. The RX is prevented from seeing the TX RF power and the

In the quiescent state all the diodes are biased on and so signal can get through to the RX (with not too much power being wasted if the RX impedence is << 1k (the resitance of the bias supply).

Am I on the right track?

Does this circuit have advantages over the conventional back to back diodes (over and above the its lack of a tuned circuit)? Does it have better isolation? Better IMD performance.

Your software must be able to output plot commands in the HPGL format. I once had the use of a HP plotter which had an RS-232 port - it still needed the HPGL commands, though. If your plot program has HP plotter drivers available, then you will probably be ok if you can find an RS-232/HP-IB converter to drive from your PC's serial port.

I recently aquired a Gerry model 600 49MHZ Baby monitor with an intercom feature. I only have the transmitter and no reciever. The transmitter from what I can tell runs on 49.830 and listens in in 49.890 MHZ. It also has separate circuitry that looks like it belongs in a garage door opener. I can only guess that this is some sort of secondary reciever needed to make the intercom work.
I have in the past converted several 49 Mhz gear to the 6 meter ham band and was wondering if this might be a useful canadate for such a conversion as a low powered 6 meter repeater or such.
Is there anyone that is familiar with this unit and or has access to schematics out there that can give some advice on this unusual baby accessory?

I'd recommend the J308/309/310 family for 2m/70cm pre-amp use. A J310
is certainly superior to an MPF102 in these applications. However, you
may need to adjust the circuit to the different specs of the J310 (have
a look at the data sheets). A 2N4416 is essentially identical to an
MPF102, and may be easier to find.

>
>What else is done for IF amps and AGC?

Well, you could use discrete devices. A 2N5109, for example, can
make a very strong IF amplifier at 9MHz. A JFET, such as a J310,
is also a pretty good choice, not as strong as a 2N5109 but since
you're planning on running good AGC this probably doesn't matter.

The drawback to using a discrete device is primarily that you'll have to design
biasing and impedance matching circuitry. The MMIC parts (MAR/MAV/MSA) are
very appealing in that they are already biased and matched. The return
loss performance at the input on most of the MMICs is quite good, you can
use it as termination for filters, but a discrete design may require a
little more work to accomplish the same thing.

A discrete design is likely to offer lower noise and higher gain, and
even may have a better output power (i.e. better dynamic range).

An overlooked idea is using one of the smaller RF power FETs as a strong
IF/AGC amplifier. They're pretty damn good on the noise figure, and offer
excellent dynamic range. I've never tried it, but even a VN10KM or somesuch
might make a good 9MHz IF amplifier.

Actually I tried something like this but used a slightly different approach.
I put a balance resister (you know, 0.1 ohm or so) after each regulator
to combine their output - I just wanted to treat them equally. Works kinda
well, but I gave up that idea for other reasons; it's hard to adjust output
voltage and I wanted to add circuits like overvoltage crowbar and variable
current limit (foldback).
I'm sure the method you've illustrated here works and works OK, as long
as you don't have to change output voltage and simply rely on current
limiting by individual regulators. That'll make the circuit pretty simple
other than possibly increasing total parts count.
Also, thanks for the suggestion on new devices, Moritz.

Hi,
I am looking for info about SFU455 ceramic filters. I have some SFU455A and
SFU455B that I plan use, if it possible, in 9600/19200 designing packet rig.

It will be well to know the next parameters:
- 6 db bandwidth
- 50 db bandwidth
- attenuation
- insertion loss
- input/output impedance
- group delay time.

Thanks in advance.

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew

Hi everybody!

First of all I want to apologize for my bad english regarding the technical terms--but being a beginner to antenna design implies not knowing all the words correctly.

I need some information on how to build a VLF antenna. It shall receive signals at 10-14kHz with an omnidirectional characteristic. It should also be quite small [<=1ft] in size.
Currently I am thinking of two ferrite bars (?) which are arranged orthogonally. What I need to know is how to calculate the resonant circuit. I also need infos on how to build a simple amplifier and connect the antenna to it. A transformation of the signal to other frequencies is not necessary.

Thaks in advance,

Wolfgang

2982. Re: toroid identification

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-15 15:55:04 UTC
From: Mike.Czuhajewski@hambbs.wb3ffv.ampr.org
Message-ID: <1994Oct15.115504.12235@wb3ffv.wb3ffv.ampr.org>
Source record: 116010

Regarding the recent question about identification of toroids, the reply from W7EL is quite correct--there is no standard color code, for ferrites or powdered irons. Some time ago I looked through catalogs from a number of toroid manufacturers to see if there was a universal code, and the answer is: of course not! Probably the best thing to do when you see boxes of toroids at hamfests is to keep on walking. You can't be sure what they are, even if the seller claims to know. And, at least around here, it seems the prices are rarely bargains, anyhow.

I wrote up the results of my catalog search in my column in the QRP Quarterly, and later sent a shortened version to the Technical Correspondence column in QST. Here's the latter, which I wrote in the summer of 1993--

Powdered iron toroidal cores are frequently used in construction articles, and many homebrewers quickly learn to associate core color with certain characteristics. For example, a red core is type 2, with an initial permeability (ui) of 10, and yellow is type 6, ui 8. Some other commonly used cores are type 7 (white, ui 9), type 1 (blue, ui 20), type 3 (gray, ui 35), type 10 (black, ui 6), and type 0 (tan, ui 1). (Incidentally, the latter is actually made of phenolic, not powdered iron, and has the same permeability as air, even though it is usually listed together with powdered iron in brochures and catalogs.)

While we may think we know this color code well, there are times that it can backfire on us. Let's say you are at a hamfest and see a box full of surplus cores at attractive prices. Since they are a certain color you assume you know what they are, but if you take some home and put them in a project you might get a nasty surprise.

The problem is that the color code we know is only used by a very few manufacturers; there is no universal color code for powdered iron and ferrite materials. Not all hams know this, due in part, perhaps, to the fact that we usually get all our cores from the same source, well known retailers who advertise in QST. Their merchandise conforms to "our" color code, but few others in industry do. The code we know is actually the one used by Micrometals; Arnold Engineering also uses many (but not all) of the same color designators.

Let's say you come across a red core of unknown origin. Depending on who the manufacturer is, it could be the familiar type 2 powdered iron, ui 10, but it could also be a ferrite core with ui of 850, 1800 or 10,000. A yellow core could be type 6 with ui 8 or ferrite with ui 10,000. The type 7 material is white, and gaining in popularity

for building VFOs due to its improved temperature stability over type 6 (yellow); but a white core could also be a ferrite with permeability of 750 or 5000, with much worse temperature stability, to boot.

The same principle applies to all our familiar colors--they can't be trusted unless you know who put them there. Some manufacturers will supply every material in their product line in your choice of gray, black or green, while others will use any color the customer wants!

The moral is to be suspicious of a colored core if you don't positively know who made it or where it came from. Unless you know the source, its color is meaningless. Instead of the nice, friendly toroid you think it is, it could be something totally different.

> MPF102, and may be easier to find.

The data sheet I have says a Siliconix U310 (Is this the same device as
J310?) 16dB of common-gate power gain at 105MHz and 11dB at 450MHz. The
noise figure is 2.7dB at 450MHz. I think this is certainly better than
the MPF102. There is also an improved version of MPF102 (MPF106, I think).

But still, this may not be the best choice for preamp circuits. Usually
MOSFETs are superior to J-FETs at higher frequency, and at 440
it would be so difficult to find a cheap J-FET that gives the gain and
NF as a MOSFET would. I usually recommend a dual-gate MOSFET for preamps
when some people might have a few in their part bin. I think the good old
40673 has been phased out but there are still plenty to choose from, like
3SK40, 3SK45, 3SK48, 3SK51, 3SK72-74, 3N204, 3N211, etc. These in general
will give you 20dB or more of gain and 2dB or less of NF in general up to
300MHz. I like 3SK72, 3SK73, or 3SK74 most, because they are rather
inexpensive and available in small microdisk package which is easier to
work with than TO-18, 72 or 92 package. 3SK72 is mostly used in TV or
FM radio, whereas 3SK74 has been found on many ham-gears from Japan.
(I think I first saw this first in my old IC-730 front-end mixer.)
There is a very good example of a dual-gate MOSFET preamp in recent
ARRL handbook.

If you have to buy something new, then I say go for a GaAsFET. There are
several types you can get for less than 5 buck a piece. A GaAsFET has
much better NF especially at 440. The handbook has several plans on this,
too.

2984. Screen Voltage Protection Circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-15 18:02:10 UTC
From: ells22@aol.com
Message-ID: <37p5f2$qlu@newsbf01.news.aol.com>
Source record: 116008

My 4-1000A Amp project is moving forward slooooly but surely. I need ideas on a sane, simple and safe (for me and the tube) interlock so that screen voltage can't be applied if the plate voltage is not present. It seems to me that I have to sense the 5KV directly, decide that it is or is not there and lock in/out the screen voltage. The circuit also has to react quickly in the event of Plate Voltage failure.

Any ideas would be appreciated. Remember I'm old, still understand 12AU7s, and need all the help I can get.

Thanks

Yes, it is over-rated. In some studies, they found that
polishing the surface smooth in preparation for plating
improved the Q more than the actual plating.

Well, from reading this thread, I figured that
moritz@ipers1.e-technik.uni-stuttgart.de
felt that calling the experiment 'lemon powered' isn't a good idea, and
would cause confusion to many people.

He wasn't really against the idea of it powering a QSO or for that matter,
probably anything else, but just, the way the 'concept' is being introduced.
(ie Lemon Power).

However, in all due respect, I would think that if the source of the
electricity (be it from lemons or otherwise) is properly explained, it'd be
pretty cool to run a rig on a couple of lemons, or anything else, besides a
battery.

For all you know, at the end of the project, KC4ROW could bring that project
+ a couple of lemons out on field day!

I would like to build up a solid-state TR switching system for moderate power (300 watts).

Questions:

Anyone have a nice, safe PIN diode design? That is, with some kind of backup if the diodes fail?

What kind of diodes, and where do you get them?

I've had good success at 5 watt levels with 2 back to back 1N914 diodes, and my Ten Tec Argosy has a nice 2-diode switch at the 50 watt level. What about higher?

The *simplest* way to do this is just to derive screen voltage from
plate voltage. Then if plate voltage is lost, screen voltage is
automagically lost as well.

Instead of drilling a hole, use two ferrite cores next to each other.
Wind the windings thru both cores, and the fractional tap would
be passed thru the gap between the two toroid cores. maybe try filing
a notch in both cores to pass the tap.

Hello, thanks for reading this.

A couple of years ago I picked up a 68.545 MHz Toyocom TQF-456C
Xtal filter at an amateur radio rally (hamfest in the US). It
was unused, and very cheap. Does anyone know anything about it?
It looks like a VHF roofing filter for an up-converting front-end
HF Rx. Putting it on my signal generator it appears to be quite
narrow band (15 KHz?), but does anyone know what the I/P and O/P
impedance is likely to be? I'd like to use it in a homebrew Rx.

>necessary.

There are two styles of small VLF antennas, the voltage probe, and the magnetic loop. Your proposed solution is a magnetic loop. However, a voltage probe style may be better for omni coverage. A voltage probe antenna is a small vertical whip that would typically use a MOSFET in emitter follower configuration to transform the impedance of the probe down to something manageable to drive selective circuits. Typical circuits can be found in Loran C equipment.

The magnetic loop is a very common approach for MF and LF receiving antennas. It has the fault for your application of having a sharp null perpendicular to the plane of the loop windings. If you combine the signals of two orthogonal loops using a non-additive mixer (IE a chopper), you can simulate an omni pattern fairly well.

Resonance is calculated by the formula F=1/(2*pi*sqrt(L*C)) with frequency in Hertz, inductance in Henries, and capacitance in Farads. Calculating the number of turns for a given inductance on a ferrite is best done by consulting manufacturer's literature. There will be charts giving a value called Al for the particular material. This is a parametric value depending on permeability and the effective magnetic cross section of the material chosen. The number of turns required is then T=100*sqrt(L/Al) where L is the desired inductance in microHenries.

While you will typically use discrete active devices at the begining of your TRF amplifier chain for good noise figure, OPamps are typically used to obtain the bulk of the gain, and gyrators are used to give the large values of inductance needed for resonant circuits. Back end processing can be by use of switched capacitor filters, or today by DSP chips.

Here is some of the info:
SFU455A: 10=/-3KHz at -3db, 5 dB insertion loss. No numbers shown in
catalog
for 60 dB. Only spec is "6 db selectivity @ -10 KHz.".

Specs are same for SFU455B, except center f is 462 KHz., and this
part is meant to be used with an IF transformer.

You might try Murata/Erie for more info; 2200 Lake Park Drive,

Call your local Motorola distriubutor or sales office and see if they'll send
you Motorola Application Note 980. It's all about using the MC3362
and MC3363, and includes a full schematic of a portable phone
receiver, which could be precisely what you want. Motorola has a
line of custom dual PLL synth chips with a separate synth for xmit
and receive, with values embedded in internal PROM for dividing down
to values appropriate for the 10 standard phone frequencies in the
US. The parts count on such a system is very low. Give it a shot!

It sounds like he wants an Omega antenna, from the frequencies.
I've heard that loops can give lower noise at VLF, since
man-made noise is on the high-impedance side; still, the
extra headaches of diversity for the two loops might
be too much.

3000. tuning circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-17 11:54:14 UTC
From: mike@io.org
Message-ID: <37tol6$hb@ionews.io.org>
Source record: 115967

I'm experimenting with a simple 'crystal radio circuit': coil in parallel with a tuning cap from an am radio, germanium diode, lm2904 opamp.

I'm trying to tune it to the 80, 40 or 20 meter bands, and have experimented with winding different coils, air and toroids. It seems that whatever coil I use, I'm always tuning either the a.m. broadcast band (~ 1Mhz) or else around 5Mhz. The circuit is on a plug in breadboard. Would the breadboard be causing this limitation in tuning?

What would the capacitance range of the tuning cap be? It's from a cheap a.m radio. The cap is marked 'Nissan PVC-2A'.

As an experiment, I tried replacing the coil with a 3.5Mhz xtal. The result was no output. Is it possible to use the xtal as a tuning coil?

One technique that I've used is to bias the amplifier through shunt
diodes. Thus, if the diode opens, allowing the signal to get through,
the amplifier will be biased in the cutoff region, dramatically cutting
the gain. If the diode shorts, it still works as a shunt element.

When new, they were probably in the 100 AH range. There is no telling what
the capacity is now since they are used but you can easily enough run a
test to determine their useful capacity. The test should be done individually
so you can determine if one is in better shape than the other. Begin with
fully charging the battery followed by a couple of hours to days off the
charger to determine the fully charged open circuit voltage. It should be
around 12.6 volts at room temperature. Next attach a suitable load drawing
perhaps 1 - 5 amps nominal and measure the initial current and battery
voltage under load. An automotive headlamp is an excellent load for this

purpose but the resistance isn't constant at different voltages so you
will need to actually measure the load current. One interesting feature
of incandescent lamps is that the resistance variation with applied voltage
is such that the current tends to be constant, handy for this application.
Periodically record the battery voltage and load current until the voltage
drops to 10 volts at which time you should consider the battery dead. The
battery capacity is then approximately the load current times the number of
hours to reach the cutoff. I suggest you make a graph which you can later
use to interpret the battery voltmeter.

>
>If I can get a bank of solar cells together that would put out 12+ volts at a
>trickle charge (100 - 200 milliamp) will I hurt the battery by leaving it
>hooked up all the time?

Probably not. As a very rough rule of thumb, I have found the float current
required to keep any lead acid (including Gel-Cells) at float voltage is
around 1.0 mA per Amp-Hour of battery capacity. This means your system would
likely float at around 200 mA and wouldn't be overcharged at that rate.
Luckily, when the battery is less than fully charged, the leakage current
appears to be more like 0.1 to 0.5 mA per AH capacity meaning the battery
will charge somewhat but probably not reach full charge.
>
>Do I need diodes in-line with the solar cells to prevent the batteries from
>leaking voltage back through the solar cells?

This depends on the solar panel. Measure the reverse leakage current and
make a determination. If the solar panel (Silicon cells assumed) has
36 cells, the diode is a winner; if it's less than 36 cells then maybe not.
>
>Is my solar-cell idea just a fantasy?

I did exactly what you're talking about a number of years ago and it did
the job but I think you'll find an AC charger will be far more cost
effective and you'll still have days of endurance if the power fails.
>
>Assuming my solar-cell idea is a fantasy, anyone have useful schematics for a
>trickle charger I can build pretty cheap?
About the easiest is to buy a cheapie 12 V power supply of the sort sold
by Radio Shack for running CB radios and car stereos and hack it. Most i've
hacked had the expected transformer, rectifier and filter capacitor followed
by a pass transistor controlled by a 723 type voltage regulator IC. Some
already have a voltage trim pot but you can easily trace the circuit and
figure out how to put one in. The supplies are usually equipped with
overcurrent protection and are good for a couple of amps; perfect for your
application.
>
>I thought it would be useful to have the main volt and amp meters switchable

>power to the outputs while switching. Any suggestions to solve this problem?

Use a meter shunt. The standard approach to the problem of switching ammeters is to permanently install a shunt resistor in series with the circuit whose current is to be measured. A typicall shunt would have a voltage of 50 millivolts for a full scale current, which could be anywhere from an amp to thousands. The shunt is connected to the panel meter which is simply a 0 - 50 millivolt volt meter with the meter face calibrated in amps. Switching the low level signal is simple but be very careful not to blow up the meter movement as they typically only require 1 mA for full scale deflection and will destroy themselves instantly if connected directly to the battery. The same meter movement can also be used to measure battery voltage with a suitable series 'mulitplier' resistor. A typical meter movement for this application will be sold as 0 - 1 ma full scale and will have an internal resistance of 50 ohms giving it a full scale voltage of 50 millivolts. You can make a shunt resistor from ordinary copper wire by calculating the length required to get the desired resistance. For example, suppose you want 2 amps full scale and you have the meter movement described above. You want 2 amps to give a 50 millivolt drop so you using ohms law, you find a resistance of 25 milliohms is required. Going to the wire tables, you find #20 AWG copper wire has a resistance of around 10 milliohms per foot and is easily capable of handling 2 amps. Make the shunt by inserting a three or so foot piece of wire in the circuit to be measured and tapping into the wire at two points along the wire seperated by 2.5 feet. Be very careful to insure it's not possible to have the meter connected when the shunt's not.

>
>I plan to place fuses inline with each output. Any suggestions on type of
>fuses, or are there small circuit breakers that would do the job properly?

Fuses are more versatile and considerably cheaper and easier to find.

>Any hidden grounding problems with the above setup that might bite me? I'm
>currently running from a homemade folded dipole, and a 5/8 wave mag-mount
>antenna, so the whole setup is floating with no earth ground at all. Should I
>be concerned with it?

I would ground the negative side to your safety ground but it may not be absoultly required.

>I know someone out there must have a similar setup. Any comments or hindsight
>observations? I apologise in advance if these seem to be trivial questions
>and a waste of bandwidth.

To begin with I wouldn't bother with the solar panel other than to allow for it in your switch/metering box. You will need a place for the diode and you'll probably find the solar panel current will be the most popular meter position. If you do invest in a panel, I would suggest you don't bother with anything smaller than 0.5 Amp for full sun as it won't help much. If you plan on keeping your radios on full time you will need a much larger panel.

Feel free to email for clarifactions or further discussion.

Mark,

Not so much that they are different "types" of frequencies (although
they are indeed different), but rather the "different" types of
activities that take place on the various ham bands.

If you are still having trouble grasping all that is above 30MHz,
the ARRL puts out a pretty good introductory book called
"Your VHF Companion". Under $20, can get at most ham stores,
or order directly from ARRL. Sorry, I don't have their number on me.

Also, "Now You're Talking" from Radio Shack is a good book.

Mike

I would not recommend the loop antenna approach with the requirements
of small size and omnidirectional. An active antenna using an FET as
an impedance transformer would work very well. This is really nothing
more than a common drain amplifier with an electric field probe connected
to the gate.

3005. SWR between transmitter and amplifier

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-17 19:39:19 UTC
From: tom_taylor@taligent.com
Message-ID: <tom_taylor-1710941239150001@tom-taylor.taligent.com>
Source record: 115888

I recently finished building a homebrew two tube 4-400 grounded grid amplifier for 80-10 meters. It works great. However, I didn't build a band-switched tuned input circuit. Without it, the input impedence is approximately 50 ohms... but not exactly. I'm driving the amp with a solid state rig (TS440s). Since the amp doesn't present a perfect match to the transmitter, I use the transmitter's internal tuner to match the transmitter to the amplifier.

Question (not a trick question, I really want to know!): Where does all the reflected power from the transmitter go? Is it radiated from the three foot piece of coax connecting the two pieces of equipment? Or is it heating up some component somewhere?

Thanks,
Tom aa6br

>(I think I first saw this first in my old IC-730 front-end mixer.)
>There is a very good example of a dual-gate MOSFET preamp in recent
>ARRL handbook.

The Motorola data sheet for the J310/U310 suggests that 1.5dB is the typical
NF at 450MHz for a J310, and the available gain is certainly in excess
of 11dB. I skimmed the data sheets for other Motorola RF MOSFETs; none of
them had a lower NF than the J310, though several of them were specified
as sporting higher gain. The simple fact is, you don't necessarily want too
much gain in a pre-amp; afterall, what good is a pre-amp that makes your
radio overload and generate intermod in the front end?

>If you have to buy something new, then I say go for a GaAsFET. There are
>several types you can get for less than 5 buck a piece. A GaAsFET has
>much better NF especially at 440. The handbook has several plans on this,
>too.

GaAsFETs can certainly offer excellent performance, but aren't exactly cheap and are generally a little less rugged than JFETs. Frankly, in the real terrestrial FM world, a super gain/super low noise preamp is probably not as much of an advantage as it is in the small-signal (EME, etc.) world. You can build a J310 based preamp for 450MHz that offers a healthy +13dB of gain with a +19dBm intercept and a noise figure under 2dB quite cheaply (under 50 cents for the J310). When the next electrical storm rolls through, your JFET will probably still be working afterwards, and only costs $.50 to replace if it fails :-)

I personally think people get too hung up on gain, sensitivity and noise figure specifications without considering the gain and noise distribution in a receiver, and also the environment the receiver is operated in. This is how we get .1uV receivers that crunch at the slightest provocation.

The original question was "what is a good replacement for the MPF102?". If the answer is constrained to JFETs, the J310 is probably the best answer in terms of price, availability and performance. It is in the same TO-92 package as the MPF102 and offers superior performance, in most cases with minimal circuit adjustment.

Good point. I would certainly go for higher dynamic range than higher
gain for my receiver design; but when I switch in a pre-amp, I really
switch in. Sometimes one really could use extra couple of dB, but it's
not usually the case when all you listen to is FM repeaters. Sometimes
having too much gain hurts rather than helps.

Right again. GaAsFETs are not cheap. But that doesn't mean that you
cannot afford one; sometimes I have to spend extra couple of bucks for
a superior performance. We have to spend extra $5 when we need 20dB more
gain and to keep receiver NF under 3dB. (The overall NF of a receiver
is mostly determined by the NF of the first stage.) But then again,
this may not be a typical requirement. For most 2m and 70cm application,
the J310 woudld be a good choice.

Yes. It is of no use, in general, to build a receiver with 5dB of overall
NF in HF, as well as one with -150 dBm of minimum decernible input.
But there might be someone who really need such things, however
improbable. Sometimes it helps to know what other ways are there.
I wonder if suggesting alternatives would offend the original poster
or others.

Give Ramsey a call. They may offer a rock which tunes the Novice portion of 40m. There are other kits, too, such as Oak Hills Research and A&A Engineering. I know that Ed Hare at the ARRL is a big QRP fan; his email address is ehare@arrl.org. He can probably point you at data you'll find very interesting. Also, if this is your first HF experience, note that QRP can be very challenging (i.e. frustrating) even for very experienced radio amateurs. A used transmitter with higher output power can often be found at swap meets or in amateur related want-ads at very reasonable prices.

>I'm experimenting with a simple 'crystal radio circuit': coil in parallel with
>a tuning cap from an am radio, germanium diode, lm2904 opamp.

Mike,

I am afraid you are grossly underestimating the requirements for a amateur
band receiver, and even for simple AM broadcast reception.
If you can get hold of the integrated AM receiver ZN414 or a descri-
ption thereof, you might learn what can be done with a simple detector
receiver.

An amateur band RX *requires* a local oscillator, for ssb or cw detection.
you find simple "direct conversion" receivers in the ARRL Handbook.

Good luck and success with future projects, Moritz DL5UH

Yes, you got it. I didn't want to use the word Omega in my first posting
because I was afraid to get less answers to such a specific question.

But as it seems that some people here heard of Omega before, I will ask
the question in another way:
Who can tell me how to build an Omega antenna?

Wolfgang

Check out the books 'Solid state basics' and 'solid state design'.
(don't know if the first one is still available).
Both will allow you to learn what you need and build your
equipment while still having a fighting chance to make it work,
and know how to fix it if it doesn't.

It will be fun!

Don't know about US regulations though.

Saw one at Wal-mart last night. It's a plastic card the size of a
credit card, with an LCD strip along one edge. The instructions say
to move it around the door of the oven for a specified amount of time
while the oven is on, and it displays a Good/Bad reading. Cost about
six dollars.

Suggest you send an E-mail to "info@arrl.org" to get information on what
resources are available from the Amateur Radio Relay League, the national
ham organization in the US. Ham publications do not address cordless
phones directly, but antenna principals would apply.

3017. Getting on 2.4 Gigahertz

Newsgroups: rec.radio.amateur.homebrew
Subject: Getting on 2.4 Gigahertz
Distribution: usa
Organization: NETCOM On-line Communication Services (408 261-4700 guest)

I have been looking into getting equipment or building some
equipment to operate on 2.4 gig in the Santa Clara Valley.
(San Jose Calif Area). I have been looking for the best ie
cheapest way to get on 2.4 gig. I have a 1.2 gig HT and some
other equipment. I have been looking at swap meets and such
but have not found anything that I can use. I am posting this
so that some MicroWave type Elmer out there might have some
wisdom to share. There are 2 or 3 2.4 gig repeaters groups
and I am talking with them also. I am a software and digital
electronics type so RF and especially MicroWave is new to me.
Any help would be appreciated.

3018. VLF Antenna Design

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-18 16:11:30 UTC
From: ka7oei@uugate.wa7slg.ampr.ORG
Message-ID: <20261@uugate.wa7slg.ampr.org>
Source record: 115946

I have "dabbled" with LF/VLF numerous times in the past... and built a number of antennas.

One of the best antennas that I built for this purpose was a shielded loop... This consisted, quite simply, of a loop, about 3 feet in diameter, constructed of CATV hardline. The bottom end was open with the shield grounded at both ends , and at the top, there was a gap in the shield ONLY. There is a sort-of drawing (note that it is square, since those are easier to draw...)

```
i-----------------l_l---------------i
li---------------------------------il
lil---------------l-l-------------lil
lil lil
lil lil
lil lil
lil lil
lil lil
lil lil
lil lil
lil lil
lil lil
lil l------l lil
lil-------------l l----------lil
li-----------------XX--------------il
i---------------l______l------------l
```

It may be a bit hard to see (I'm not very good at ASCII "art") but there is a gap in the shield at the top, but the shield is connected at the bottom. The "XX" in the box is the RF amplifier/transformation circuit.

The one I built, again, used CATV hardline with a slot carefully sawed in the shield at the top, using some kludged compression fittings at the bottom on an aluminum case. I also built one using copper tubing (it was easier) and in that case, I was able to more easily mount it at the bottom using the readily-available compression water fittings.

The XX circuit could be any number of things, but one thing that DOES work relatively well is just a simply audio transformer of the 8-ohm type. (Yeah, like the one they sell at radio shack...) The 8 ohm side goes on the loop, and the other side connects to a common-gate FET preamplifier. Depending on frequency, etc, I experimented with the centertap on the audio transformer for best signal.

I built this loop and it worked well even into the AM broadcast band (the transformer itself is "OK" - not great - to over 100 KHz). On this single-turn loop, you can often broadly resonate the loop with some capacitors.

It may take several 10's of nanofarads to do it at 100 KHz, and maybe several microfarads farther down (hint: use a huge pile of mylar caps... electrolytics really suck rocks for this...) A friend of mine use the copper-pipe loop (did I mention the single conductor of wire in the pipe?) and resonated a multi-turn secondary.

The trick is, with an H-field loop, is to keep the shielding in good shape. The one that I built with copper ('never tried it with the aluminum coax version...) I could null out a local 50kw AM station. You can't do that if the antenna happens to respond to E-field, as well, so you have to make sure things are in a shielded enclosure.

One thing is sure: with a single-turn loop, the ONLY good way to match the impedance of the loop element itself to any practical amplifier circuit is with a transformer. This is because the impedance of the loop can be a small fraction of an ohm at these frequencies...

One word about E-field whips: I have a decent E-field whip and it works very well... provided that you are NOWHERE NEAR a powerline... Its frequency response extends into the KHz region (if I place it near an audio line, like one leg of a speaker wire...) I can hear what is being carried if I have the output of the antenna connected to a high-gain audio amp... but the OMEGA signals will drive you bananas, too...) If you are 'bent on building one of these, I would consult one of the several articles written in the past by Ralph Burhans that have appeared in 73 Magazine. HE knows of what he speaks! Again, they DO work well, but in urban environments, expect to hear a lot of noise... unless you are lucky... and no-one is using a light-dimmer in your neighborhood... Even then, you could use a synchronous noise-blanker, but thats another story...

FWIW, I posted in the alt.binaries.pictures and a.b.p.misc groups a JPG picture file of my homebrew 2 meter indoor J pole antenna and a homebrew 2M radio (using the "guts" of a Motorola HT220 and an output RF amp to make 8 watts on packet). It's quite old, but it works well. Works better when I used a short length of "Ethernet" coax (equivalent to RG8U, 50 ohm) to feed the J pole.

The picture file is UUencoded, run uudecode to get the JPG file.
B&W photos with color labels, JPG quality around 65.

Slight correction here Bob. The "Norcal-40" is out of production and has
been for some time. The current project offered up is a multiband CW QRP
rig called the "Sierra". The designers of the "Sierra" have put the
engineering model rigs through massive amounts of pre-production testing
resulting in a very well thought out QRP rig. First run orders are closed
but I understand that subsequent order runs will be comming.

3024. BPR2000 and Golay code

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-19 11:55:45 UTC
From: todd@wrtfac.day.cdc.COM
Message-ID: <400.9410191155@wrtfac.day.cdc.com>
Source record: 115883

I am working on building a transmitter controller for a Motorola "BPR 2000" Series display pager. I have some documentation from Motorola, but the paging format information lacks the detail I need to program the controller.

The first question is about the logic encoding. Is the carrier frequency just shifted to encode the ones and zeros? How much is the carrier shifted, and in what direction for a one or zero?

The next question is about the 18 preamble words. It is said that all 18 words are the same, and each word is 23 bits. Also that the preamble word is selected from a code set of ten. What are the ten preamble codes, and what part of the code plug number determines which of the ten is correct for a pager? Does the preamble word use the (23,12) Golay code, with 12 information bits and 11 parity bits?

The start code is made of two 23 bit words. What part of the code plug number determines the start code, and how is it encoded? Is the start code also 12 information bits, and 11 parity bits?

The address is also made of two 23 bit words. It would seem that part of the first 6 digits of the code plug number include the address. So how do you figure the address from the code plug number? Does the address use the (23,12) Golay, with 12 information bits, and 11 parity bits? If the address only has two words with 12 information bits each, then that is a total of 24 bits for the address, allowing a total of 16,777,215 addresses. The Motorola theory manual claims that only 400,000 address codes are possible, and this conflicts with what can be encoded into 24 bits. Even if they were using BCD in the 24 bits, that would allow 999999 possible addresses, so how did they come up with the 400,000 number?

Each pager has a 4-call capacity, with each call represented by one address. So each pager has 4 addresses. How are these determined? Which address is for "call 1" (tone-only source 1), "call 2" (tone-only source 2), "call 3" (tone & data source 1), and "call 4" (tone & data source 2)?

And then we have the data blocks of 8 words, 15 bits each. The data blocks use a (15.7) Bose, Chaudhuri, and Hocquenghem (BCH) code. What are the details of this BCH code? How many bits of information can be packed into 15 bits using BCH? How are the characters encoded? What characters are supported? (0-9,Abcd,space,dash)? Is the 1/2 bit space between data blocks always the opposite polarity of the next bit?

With the fields that use the (23,12) Golay format, how are the parity bits calculated?

The timing seems to be clear, 300 bits/sec for preamble, start, and address. With data and comma bits at 600 bits/sec. The one question I have is about

the 1/2 bit space before the data block, is that 1/2 of a 600 bits/sec, or 1/2 of a 300 bits/sec?

>Do you have any info on that?

Use a shunt regulator. In the old days we'd use 5 VR-2 regulator
tubes in a series string, today an amplified zener circuit would
work. If the plate voltage dies, the screen voltage will decay
along with it. The only potential problem with this setup is a
shunt regulator failure. That would allow the screen voltage to
rise to near plate voltage. So you should choose the resistor to
limit screen current to a safe value if that happens.

```
------------------------------
| |
Plate --|--- R
Screen ---------x------|
| |
r Shunt reg
| |
GND GND
```

R is the shunt regulator resistor and r is a safety resistor that
takes over if the shunt regulator fails. It should be a fairly
high value so that it doesn't swamp the regulation in normal
operation.

Another way that's more modern is to use a sample of plate voltage
to drive a screen relay so that it pulls in only when plate voltage
is present. The screen supply can then be a separate supply.

```
dropping resistor R ----r----
Plate supply-------/\/\/\/\-|-)))))))|-Gnd
======
Screen supply---------------> |-------x--- to tube screen
| |
/ / tube
\ safety bleeder \ protection bleeder
/ /
| |
```

Gnd Gnd

Note: if the relay coil were to open, a potentially dangerous
condition could exist. Full plate voltage would appear on
part of the winding, and could arc over to the relay frame.
To mostly prevent that, bridge the coil with a high value
resistor to limit the potential across the coil to the ratio
of the safety resistor (r) to the dropping resistor (R).
Choose R so that with full plate voltage present, the current
draw will be correct for the relay to pull in. For a 20 ma
(nominal 600 ohm coil) relay, R would be about 250k for a 5kV
supply. Make r about 25k and no more than 500 volts can appear
if the relay coil opens. That should be pretty safe for most
relay insulation.

Oops! Slight correction here Paul! The Norcal-40 version II is in
the works at this time. The announcement was made a couple weeks
ago on the QRP newsgroup. Price for this transceiver kit will be in
the $89 range. It will incorporate a good many of the improvements
and mods that the NorCal members invented.

Check the QRP email newsgroup for further details.

I've had a TH78E for a couple of years (the European version) and I'm
quite happy with it. Having a broad-band front end the Rx overloads
in some environments with strong signals, even with the rubber
duck antenna! I don't really like the sliding cover for the keypad
and I see that they have dropped the idea for the TH78 replacement
that has just come out. I've played with the advanced features, but
don't really use them. I find the tone burst operation awkward - I
don't like the separate button and would prefer it on the PTT.

I've been told that the speech quality is very good with the built-in
mic, and even better with the SMC-33 hand-held mic.

You can set it up so that the Rx covers 50 MHz up to 950 MHz, with
scanner facilities, although this isn't in the manual. AM detection
is provided for the air band. It even has a couple of games programmed
into its ROM!

FOR TRADE, OR ????

One Model 28 ASR Teletype, complete.
Includes spare Model 28 RO less cabinet
i.e. a spare printer mechanism with base.

The 28 ASR has a regular friction feed platen.
The 28 RO is equipped with a pin feed platen,
vertical and horizontal tab kits (was used to print
airline tickets). If you really want it I have the
Teleticketer (tm) control box - essentially a 300 baud
autoanswer modem with answerback and a loop current generator.

This unit has been in storage in the back of my garage for the last
5-6 years when the current owner moved from a house into an
apartment and asked if he could store it in my garage. I believe it
was working at that time. He has since lost interest in it, and told
me to get rid of it. Manuals _might_ be available - if any interest
is shown, I will put the prospective buyer in touch with the current
owner.

I didn't expect this simple circuit to function as an amateur band receiver.
It *does* work for AM broadcast reception, and as I mentioned, I'm also able
to receive ~5-6Mhz.

What I'm trying to do for starters is just get a preselector circuit tuned
to a desired frequency range. I thought I would try using the crystal for
a tuning coil since I wasn't making much progress with creating a toroid/
cap combination.

I guess maybe investing in a couple of hundred (thousand ??) dollars worth
of test equipment might make it easier to construct a functional ~$100
receiver ;)

Sounds frightening, doesn't it? I would think it's more dangerous to use
a regular transmitter because you'd be making microwaves more efficiently.
It would be a wild EME experiment, woudn't it?
Hypothetically, how would you connect the magnetron to an antenna, and
what kind of antenna would it be? A horn? If this is possible, legal, and
useful I think I might want to try it someday after I learn a lot more about
microwaves, but for now it's a lot of fun to think about.
Any thoughts or ideas on this?

well, there was an article in 73 magazine a few years ago about
building an FMTV (amateur) transmitter with an oven. I think the guy
built a special coupler to tap out the energy (like maybe a homebrew
waveguide-> coax "de-launcher"). The problem cited in the article was
that the magnetron was not particularly stable. They're pretty
wideband.

He did suggest phase-locking the oven to something though :)!

><Clint>

>ka7oei@uugate.wa7slg.ampr.org

I tried a E-field whip to get WWVB at 60kHz and I'm two blocks from
a major power feed into Seattle-- you're right-- I couldn't get it
to work, while a 7.5 inch ferrite rod with 100 turns bifilar, resonated
at 60kHz was great. I also got too much of Jim Creek (NLK) at 24.8kHz
with the E-field.

The trick with e-field is that you need to have it higher than interfering
signals-- tough for me with a single story house and transmission lines.

Not really. Most ovens have less power then the best HAM setups.

How would you modulate the signal? CW might work if the magnetron can
be switched on and off fast enough.

3040. The Little Razor Blade Radio

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-20 17:10:07 UTC
From: burt@teleport.com
Message-ID: <38689f$mej@sandra.teleport.com>
Source record: 115891

I am having the greatest time discovering the secrets of this
gadget.

It's principal components are a razor blade and a pencil lead.

You wrap a coil (120 turns) around a toilet paper tube.
One end communicates with the antenna and the razor blade.
The other end communicates with the ground and the earphone.
the earphone sits between the pickup (pencil lead attached to a paper
clip) and the ground.

At present, all i can get is the same station at 970 KH, regardless of
the size of the coil, or the kind of razor blade.

It even works when it is *not* grounded! (Go Figure).

Would anyone care to elaborate on this subject, offer ideas for
improvement while keeping things primative, or share similar experiences
with similar types of receivers?

Thanks,

-burt

> Thanks Robert (KB0PED)

There are quite a few 40 meter transmitter kits available these days. Ramsey doesn't have the best reputation but I have built one of the 40 meter QRP transmitter kits you mention and found it to be well designed, easy to assemble and it generates an excellent signal. I think it's power output is only around 1/2 watt on a 12 volt battery however.

The transmitter frequency is controlled by a 7.04 MHz crystal pulled with a varactor circuit up and down about 20 kHz. The circuit board has provisions for a second crystal, including selection switch. The manual specs the crystal as parallel resonant with a 32 pf load capacitance (HC-6/U holder) but just about any modern 7 MHz crystal should be able to work. The manual suggests Jan Crystals (1 - 800 - JAN - XTAL) as a suitable vendor.

I'm thinking of doing the same thing myself on 432 with tube amps.
If you do it I'd be glad to hear how it goes. I hope I'm not boring
you with the obvious, but the problems I've thought about is that with
tube amps, they are not likely to be identical (pahse shifts through input
and output circuits and fiddling to get each one tuned up). If you use
a combiner then the two rigs will interact as you tune them. If you
tune each for maximum smoke then you need two identical power meters
in each line. I don't know how different the phase shifts can be before
you get into trouble.

The other thought is to use hybrids to combine the power - the
amps don't interact and the unbalanced power dumps out one port and
can be watched with a power meter. This arrangement seems simpler
to tune. However if you extend it to four amps, it becomes a nightmare -
you need 3 hybrids on each side (input and output), while for the
combiner approach you only need a different combiner. I can't imagine
that you could tame 4 amps on combiners.

I have heard of people putting two tube amps together but
I don't know how easy they were to tune.

Good luck

Joe Mack NA3T

3044. low power fm short range xmitter

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-21 02:04:18 UTC
From: jim_b@ix.netcom.com
Message-ID: <3877j2$qt5@ixnews1.ix.netcom.com>
Source record: 115869

Hi.

I am interested in information on short range fm transmitters. I have an application in mind that calls for transmitting up to 100 feet from the transmitter location, to be received on a radio such as a Walkman or similar FM radio. Stereo would be a nice plus, but it is not required. Also, if the only solution that satisfies requires building a device from scratch, this is acceptable.

I have tried several inexpensive commercial devices, but they are all unsatisfactory, in that the signal is loaded down with static or other noise.

If anyone has information that might be of help, please e-mail me at jim_b@netcom.com. I apologize for the fact that this is not quite an amateur radio topic, but I could find no better starting point. If anyone can suggest a better forum for this type of request, please let me know.

Thanks for your assistance!

>I have several identical 2m amplifiers. Could anyone tell me how
>feasable it would be to operate them in parallel using phasing cables
>on the inputs and outputs similar to phasing two antennas?

That's not really feasible, the interaction will make tuning any
of the amplifiers an exercise in futility. The output of each
amp will be feeding into the output network of the others. That
way lies madness. You can use Wilkinson combiners and splitters,
but you'll still need some way of adjusting the phase of the signals,
otherwise you'll just be dumping power into the reject loads. Line
stretchers would work, or you could use lumped element networks.
The problem is that even identical amplifiers won't have the same
phase shift through them, and phase shift can change with varying
power levels, but the outputs need to be in phase to combine
constructively, so you have to have adjustable phasing to get
them all to the same phase at a given frequency and power level.
Most broadcast transmitters today are built up from a bunch of
modules combined in that fashion.

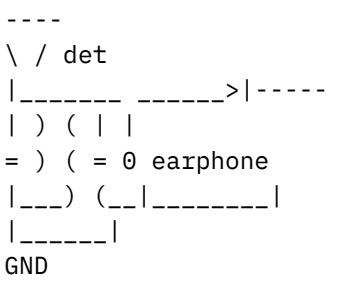
Burt, the tuning of your design depends on the electrical length of
the antenna and the inductance of the loading coil. To change frequency,
you have to change either the length of the antenna, or the inductance
of the coil. There are several ways to do the latter. Inserting ferrous
metal into the coil tube will increase the inductance, or inserting
brass will lower it. You can place taps on the coil and switch them.
You can sand off the insulation in a line and use a slider contact
to tune the coil. Etc.

All of these approaches are "classic" but none of them offer much
selectivity. As you've discovered, a strong local signal will still
dominate the equipment no matter how you alter the tuning. To get
better selectivity, you'll need to resonate the coil and form a
loose coupler by winding an identical coil on the form and
resonating it as well. By varying the spacing of the two coils
on the form, you can make the coupling tighter or looser. The
looser the coupling, the sharper the selectivity you will have.
(the razor blade detector goes in the secondary circuit.) But
of course, the looser the coupling, the weaker the signal will
be at the detector. You may want to advance to a more sensitive
detector, such as a galena detector or an electrolytic detector.
The latter is a metal cup containing lemon juice with a cat's
whisker dipped in it and pulled up to form a meniscus. That's
about as sensitive a detector as you can make without getting

into vacuum tubes or solid state devices.



If you make the coils variable, you can form the capacitors out of alternating layers of aluminum foil and wax paper. You can tune them a bit by making a screw clamp to tighten or loosen the stack. Or you can make your own air variable capacitors out of metal disks. Brass washers cut in half make good capacitor plates, copper would be even better. One set would be fixed, and the other set soldered to a shaft.

You can also experiment with tapping the antenna and the detector up or down on their respective coils. this will be an attempt to better match the impedances for better power transfer.

Gary

lengthy post deleted to save bandwidth.

I got several pieces of e-mail, and saved Gary's post for further experimentation.

Anyone else have any ideas? Or want to talk about powering the thing up using lemons for batteries? Or stuff like that?

Thanks for your post gary, I'll try some of the things you suggested. I just think it's neat to make something marvelous out of virtually nothing. :)

-burt

44 foot hot galvinized steel tubing telescoping mast. can be adjusted in length from 10' to 44'. has 5 sections, each segment has hand clamp and attachment points for 4 guy wires. base segment is 2.25"od top segment is 1.25"od. each segment has provisions for being pinned at max extension.

this is a heavy unit so shipping is likely going to be expensive.
delivery possible in Texas.

kris

3059. RF Printed Circuit Board layout design?

> Any thoughts or ideas on this?

A magnetron has a coaxial output. It is possible to use a coax to wave-
guide transition (1/4 wavelength on one side to short and >1/4 on other
to open)

Feed this to a dish and you probably would have enough EIRP to fry passing
fowl.

Magnetrons are very noisy (phase noise) though and probably not too stable.
There are probably other devices that are more appropriate for use at
2.4 GHz.

>Question (not a trick question, I really want to know!): Where does
>all the reflected power from the transmitter go?

Tom,
Supposing the tuner of the ts440 works OK, which it surely does
the power will be reflected by the tuner back foreward into the amplifier.
There part of it will be amplified and some will be re-reflected....
So the standing waves on the line, as in the combination tuner-antenna.

I wouldn't try it Ken. For one thing it wouldn't be too cool for your
workers,
also it is ILLEGAL! You can get yourself into some deep, hot doodoo for
intentionally jamming commercial (or amateur) signals/broadcasts. Not only
would
you loose your ham ticket (if you have one) but you could spend time in
prison
and have some hefty fines levied upon you. Just do what I did, buy a small
pocket
radio or cassette/8track/CD or whatever with headphones.

Use a pair of quadrature hybrid branch line couplers, one on the input
and one on the output. Be sure the terminating resistor on the fourth port
of the output hybrid can handle the power dissipation that will result from
any impedance mismatch the output sees.

Patrick, Dana & J.D.-

My recollection of the MPF102, is that it isn't very good at 400 MHz, while the 2N4416 is. The 2N4416 is a Mil-Spec part, so it may be available from surplus parts sources. Even if the MPF102 is easier to get, it isn't nearly as good a choice at 440. The 2N4416 has tighter specs, but it is close enough that there should be no circuit changes needed for the substitution.

Hi,

I've added some aluminum right angle profiles to an amplifier I have in an attempt to beef up the heat-sinking capacity. The Al profiles are not coated. Will it make much difference if I paint them black ?

(I have one source, Tremaine, saying the "emissisivity" of plain Al is 0.05 and for black painted: 0.8. This seems like such a huge step. Couldn't find anything on this in the ARRL but maybe I flipped the pages too fast ? Also, I've seen plenty of Al headsinks with a golden finish and now I wonder :-)).

thanks,
john

3073. Requesting tunnel diodes

Newsgroup: rec.radio.amateur.homebrew

3074. Impedence matching?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-25 05:37:25 UTC
From: ian.mitchell@research.utas.edu.au
Message-ID: <38i5il$8d8@franklin.cc.utas.edu.au>
Source record: 115909

Hello All,

I am building a (fairly) simple direct conversion SSB receiver
for the 80m amateur band to test out some ideas using a 74HC4046
PLL before building a more general coverage receiver.

My question relates to impedence matching at the front end.
I would like to use a BP or LP filter. I assume that the input
impedence of the filter should match the antenna impedence, or
else I should use a balun.

With the filter I'm using the output impedence is the same as the input
impedence. The first active device in the receiver is a jFET which
has a high impedence.

So, can the filter output be connected to the input of the jFET with some
series capacitance, or does the filter output require some form of load
to operate into efficiently, and if so, how is this achieved?

I look forward to any advice, thanks, Ian

Hi Ray, If the transmitter impedance is 50 ohms and the load is 50 ohms,
then a 100w input transmitter will deliver no more than 50w to the load.
Yet we know that a 100w input class C amplifier will deliver much more
than 50w to the load. How do you explain that?

> Your suspicion is correct! Some of the power that is reflected turns
>into heat in the TS440s.

Well actually only a *very* small fraction. Since the WSWR is reasonable
in the given example, the internal matching NW of the trx will re-reflect
most of it foreward into the load.

BTW, even if operating a typical transistor amplifier into an
unmatched load, it will re-reflect most of the returning power.

>If the transmitter is not matched to the line and neither is the load, you
>will have pulses running back and forth down the line until all the energy is
>dissipated.
>
>Ray Mack

Again, only if the reflectivity of the load is very high, i.e.
a VSWR of 10:1 or roundabout. Else most power is likely to find
its way into the load eventually.

: Hi Ray, If the transmitter impedance is 50 ohms and the load is 50 ohms,
: then a 100w input transmitter will deliver no more than 50w to the load.
: Yet we know that a 100w input class C amplifier will deliver much more
: than 50w to the load. How do you explain that?

The full power is being transferred, however the voltage does
drop across the load, by 3db. If one were to measure the open circuit
voltage of the source, one would see a voltage higher than that seen
when the load was attached (since no load is attached, note that no
power is being delivered to anything). That doesn't mean that power
is being dissipated in the source, but that there is a source
impedance of 50 ohms.

anyway... I hope this helps to some degree. I guess it all
depends on how you make your measurements...

That generates a different set of problems. Now you're operating
a phased array with a pattern that's dependent on the different
phase/frequency responses of the two amplifiers. That may be
undesirable for a number of reasons, not the least of which is
that it may direct your 3db increased signal in a direction
such that the desired destination station receives 7, 9, 13,
20 or more db less signal depending on the exact pattern that's
established. *And* now your system is not reciprocal unless you
can find a suitable way to combine the signals from those antennas
with the same relative phasing to feed your receiver.

You've fallen into a common error, Ray. An active transmitter is not a
dissipative load, 50 ohms or otherwise. There's no resistor inside its
output port waiting to absorb the pulse. As I covered in another post,
the pulse will be effectively totally reflected from the working transmitter,
neglecting circuit losses. The output impedance of a working transmitter
is simply the *loadline* (E/I) of the output stage, transformed in impedance
by the output network to appear to be 50 ohms at the output connector. In no
way is it actually a physical resistance. All of the RF energy eventually
is absorbed by the actual load, perhaps after many reflections if the
mismatch is great, just like circulating currents in a tank circuit, or
dissipated in circuit and cable losses. It is *not* dissipated in the
output impedance of the transmitter. An output impedance is not equal
to an input resistance looking back into a working transmitter's output
port. Remember, power can only be dissipated in a real resistance.

: antennas?

Because this simply pushes the problem from one place to another: though the amplifiers might not "complain", you won't get the radiation pattern you want unless the antenna _system_ is properly constructed and fed. Two arbitrary antennas fed in arbitrary phase will get you a very strange pattern most likely.

I don't know about the SB, but some amateurs are using the Cardinal
PRO16 and similar sound cards based on the Analog Devices ADSP-2115
DSP for PACTOR - HF packet radio.

I know that Mort, KA1OTP has sucessfully done this 1296 MHz receive.
He uses and array of beams (probably loop yagis) and uses separate
preamps. This avoids the high line loss problems that affect receive
more than transmit (assuming your transmission lines aren't cooled with
liquid nitrogen to reduce their noise contribution :-)).

This might be interesting for 432 EME. Back of the envelope
calculations indicate that four sets of 100 watt bricks/0.3 dB NF
preamps/FO-22 yagis (all mast mounted) ought to hear echoes
quite well. There is a big gain is on receive from eliminating
phasing line losses ahead of the preamp. An advantage of this system
would be that RG-213/U could be used for all the coax runs. And,
if you are homebrewing everything, it isn't necessarily four
times more expensive to build 4 amps/preamps/antennas.

Finally, you might try out your system with cheap amplifiers,
perhaps MMICs and homebrew transmatches. This might let you
evaluate how well it will work before you apply real power.
Yeah, its not as exciting as smoke testing...

Message-ID: <1994Oct26.101327.1@hotblk.aed.dsto.gov.au>
Source record: 115849

Can anyone help me with a circuit diagram for a Rotex model 600 ultrasonic cleaner, or tell me the part number of the active device in the oscillator.

Does anyone know if it is a bipolar transistor, or a FET, and what it is?

I have written several letters to Rotex over the past eighteen months without getting a reply. Perhaps I have the wrong address, or Rotex are no longer in business.
The address that I have is;

ROTEX CO
8816 Director's Row
Box 560428
Dallas Texas
75356

I would appreciate if someone with a phone book for Dallas would confirm that the address I have is correct, or send me the correct address or fax number, or confirm that Rotex still exists.

Any information would be gratefully received.
Thank you in anticipation.
Jim Gordon.

Hmmmm... maybe you can help us all out and measure the phase noise of this receiver. The HC4046 VCO is reputed to be quite noisy; are you using the on chip VCO or an off-chip VCO.

>With the filter I'm using the output impedence is the same as the input
>impedence. The first active device in the receiver is a JFET which
>has a high impedence.

A JFET doesn't necessarily have to have a high input impedance. A grounded gate (also called common-gate) JFET can have a fairly low input impedance, which is inversely proportional to the gain of the FET. An MPF102/2N4416 ends offering an input impedance of about 200 ohms, a U/J308-310 ends up offering about 60-80 ohms of input impedance.

More importantly, the input impedance of a common-gate JFET amplifier is almost entirely real, which is appealing for terminating a filter. Restating this, the input impedance of a common-gate JFET is resistive over a wide range of frequency.

Other options include using an MAR/MSA device, which offers an excellent input match to 50 ohms but will tend to be noisier and more expensive than a JFET. Also, you'd need to use a strong MSA part, like an MSA-1104, which offers a P1db of +17dBm with a NF of 3.3dB or so. At HF, this device might be a really good option.

Yes it is a good idea to try to roughly match the BP or LP filter at the RX input at both ends. For the filter to work as designed, it needs to be driven by a source of specified impedance. Also, the load should be the one it was designed for.

However, don't be too paranoia about terminating your front end filter. Real world antennas are only 50 ohms at the design frequency, at out of band frequencies (where the filter is supposed to reject signals) the source impedance could be anything. It is valid to assume your antenna is 50 ohms and resistive at the operating frequency if it gives you an VSWR of 1 on transmit.

You mention the filter you use has an input impedance equal to the output impedance ('half wave filter'). The JFET that terminates the filter forms most likely a load much higher than 50 ohms, so you should really step down the JFET gate impedance to 50 ohms for the filter to be terminated properly.

An easy way of doing this is to swamp the gate with a 50 ohm resistor, your filter will like this :-) A better way is to wind a transformer and try to properly match the gate impedance to 50 ohms resistive, e.g. swamp the gate with 1 k and put a 50 ohms -> 1 k transformer in front of it.

Aside from making your front end filter happy by properly terminating it, we have a couple more issues here. Firstly, you want to maximise power transfer from your antenna into your JFET for best receiver sensitivity. Secondly, the JFET needs to be driven by such a source impedance as to give you the best signal/noise performance. Ideally, you want to meet all three requirements... a bit like finding the Holy Grail :-)

In reality, you make trade-offs, and decide that the QRN on 80 is high enough for the noise performance not to matter much, and you are getting signals at 20 over nine so you don't worry too much about sensitivity. Also, the RX is a prototype test bed for a PLL anyway, but you would rather have good out of band rejection to keep the intermods down so the emphasis is on filter termination.

Have a look at Solid State Design (ARRL) for some practical hints on receiver front end design, gain and noise considerations. Chris Bowick's book as mentioned by WS2B is excellent too, for filter design

Cheers,

Wilbert, ZL2BSJ

From: dlee@esd.dl.nec.com
Message-ID: <Cy9JI6.A76@esd.dl.nec.com>
Source record: 115790

I'm looking for info on how to transfer data over a FM Radio. I'm not sure if I'm in the right newsgroup for this or not but it seems to be the closest that I've found. More specifically for example would be something like how the airlines send data from the airplanes to the control towers (or wherever) which they do over the same frequencies that they talk over (they apparently hit a button to disable the mike and do the tranmission). Is there a chip that could interface to the microphone to send the data over.

Any info would be appreciated, books, chip manufacturers, other newsgroups anything, e-mail or post would be fine.

Thanks in advance,

Don

CC015012@brownvm.brown.edu wrote:
: Re. Heatsinks and black Aluminum:

Most of the heat would be lost by convection into air flowing vertically across the fins. This has nothing much to do with emissivity, but the black paint limits the heat flow to the fin surface, so the temperature goes UP.

Radiation loss is certainly improved by black paint, but the temperature needs to be quite high before radiation becomes the main source of heat loss, as would be the case for cooling a combustion engine. Emissivity is to do with radiative loss.

My advice would be to stick with the metal surface unless you can black anodize it.

Source record: 115783

Hello OMs,

Following the thread "where does the power go" I thought that
some clarification might be usefull:

Output impedance of power amplifiers

There is a common misunderstanding regarding the output impedance
of power amplifiers designed for 50 Ohms loads and to their matching to a load.

Small signal generators used as test equipment have indeed 50 Ohms
output impedance: their output stage is a low impedance voltage source,
followed ba a *physical* 50 Ohms resistor, which dissipates half the
power generated and serves the purpose of absorbing any signals reflected
from unmatched loads.

All wide band power amplifiers, amateur or professional (e.g. the ENI
1-550 MHz amp in my QRL) behave somewhat like an audio amplifier
(Yes I am simplifying here, but this does not affect the general
message). They are IN FIRST APPROXIMATION a voltage source,
with a maximum current capability. If operated into a too
high impedance, they will not deliver the maximum current and power,
and if operated into a low impedance the maximum current will be exceeded,
and suitable safety circuits will hopefully be activated. For complex loads
things of cause look a little more complicated.

So therefore class C amplifiers are capable of efficiencies far
in excess of 50%!.

PROOF? If a mismatch is present, normally the foreward power reading
changes also, even if no RF is present on the outer of the coax.
(This common effect dissapears, if the reflected power is dumped in
a circulator with terminated 3rd port). this change is due to the
re-reflected wave adding or substracting to/from the TX foreward power,
depending on the phase.

I hope this is of help, 73, Moritz DL5UH

I would say that as long as the coax between your exciter and the amplifier is less-less than a wavelength, that you have a tuned circuit on the input of your amplifier - the output tank/matching circuit of the exciter. The coax then acts like a lumped RLC as far as the excitor and amplifier are concerned and the coax RLC are tuned out by the exciter.

Length matters in two ways here:
- attenuation. In this case, shorter the coax the better
- transmission line transformer: here the relationship is non-monotonic.
For instance, going from 3/8 to 1/2 wave in coax electrical length will
will result in "less" impedance tranformation from input to output even
though the coax is longer.

I also still have the kits mentioned in the article. There has been an address change however:

CW Technology
7328 Timbercreek Court
Reynoldsburg, OH 43068-1181

These interfaces are also going to be in the Station Setup and Accessories chapter of the '95 Handbook.

Feel free to send e-mail if you want specific information. Thanks.

Only if the gate capacitance is low enough to be absorbed into the end
capacitor of the ladder filter. And that only works for bandpass filters
because the real part of the admittance is a strong function of frequency.
Not practical in most cases.

>and single-terminated filters are just two cases of the generalized ability

The Zverev reference I cited has tables for intermediate situations where
you want to go from say 50 ohms to 500 ohms, etc. You could also look
at impedance transforming bandpass filter tables which appeared in
IEEE Trans. on Microwave T&T about April 1966 or so.

Burt

At last - I knew someone else must have tried it ...

Several years ago I posted a question asking whether anyone had ever made
valves (tubes for those Stateside) in peanut butter jars. There were
many replies but noone had. How did you pump it down (what sort of pump
is necessary?

All this high tech is bad for home-brewing :-) Every once in a while
it's nice to make a crystal set or something that doesn't need an semi-
conductor fabrication plant.

One of my first projects (that worked) was a carbon microphone made by
breaking a razor blade in half and fixin each have so that the notches
faced upwards. A pencil lead was then placed across the two blades.
As you talk at it the resistance varies & voila - a carbon mike.

Anyway, back to the thread - Burt how about a note describing the
procedures you used in a little more detail?

Anyone else for homebrew semiconductors? There's lots of sand about :-)

Cheers
Giovanni

Unlike other MAR/MSA devices, the characteristics for MAV-11 (and
appearantly also for MSA-1104) are not specified down to DC.
The specified frequency range is 10 MHz - 1000 MHz.

For DC and other low frequency applications MAR-4 (MSA-0485)
P1dB +11 dBm, NF 7 dB might be more suitable (DC - 1000 MHz).

Please note that as MSA/MAR/MAV MMICs have a lot of gain well above
1 or 2 GHz, it is very important to keep strong TV and FM-broadcast
signals out of the amplifier. Elliptic low-pass filters and capacitively
coupled band-pass filters are problematic, as their attenuation at
VHF and UHF frequencies might be only 20-40 dB.

A normal 3 or 5 element pi low-pass filter at the input will usually
do the trick.

3110. Six meter "cavity" filter

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-27 04:30:46 UTC
From: wrt@eskimo.com
Message-ID: <CyBDvG.4qo@eskimo.com>
Source record: 115797

Several people have responded to my earlier post about my experinces with a six meter "cavity" filter asking for construction details, so here they are. If you didn't read the post, I should repeat one caution about this unit - while it is pretty sharp and totally cured my intermod problem here, it should only be used for receiving. It has a measured 3db insertion loss and that's too much to tolerate for transmitting. If one wanted to improve that, it could be made out of some low-loss metal and/or silver plated, but hey - much of the appeal of this is making it out of what otherwise would be trash, so please keep that in mind.

One other thing before we begin. The word "cavity" is used pretty loosely here. It does LOOK like a cavity in the microwave sense, but it really isn't. It's much too small for a six meter wavelength. What it really is is a single-turn loop with identical inductive coupling in and out. One of the neat things about it is that if you make it exactly symmetrical it won't affect your SWR or impedance matching to the receiver at all. The impedance step up or down on the input is exactly matched by the impedance step down or up on the output. There's just one adjustment which you tune for max signal strength and that's it. Compare that to a conventional L-C filter which can be tricky to align, especially the multi-section high or low pass units.

Having said that, here we go:

You'll need two three-pound coffee cans, three six-ounce juice cans, two standard SO-239 coax fittings (BNCs would be ok), about two feet of #14 bare or enameled wire and one variable capacitor of about 200 pf.

Here are the measurements of the cans used here: The coffee cans are 6 1/8 inches in diameter and just a hair short of 7 inches long. The juice cans are 2 1/8 inches in diameter and 3 7/8 inches long. These dimensions were common back in the sixties when this was built, but if you can't find exactly the same today, just get as close as you can. Because of the characteristics mentioned earlier, there's a lot of range on this thing and it'll work fine.

Your two coffee cans will probably have the tops gone when you get them. Take one and remove the bottom also. Place them end to end and solder them together so you have one long skinny six pound can. The metal will probably not solder well if it's very old, so shine it up with some sandpaper or brillo pads, etc, and use extra flux if you have it. For years we've all been told not to use acid core solder on electronic items, but here is one case where you could IF you wash it off carefully afterwards. Don't use it on the coax connectors or the capacitor.

Install the two coax connectors opposite each other, about 8 inches up from the bottom. This will place them about one inch above the joint of the two cans. Take your #14 wire and solder it to the center of the connector. Bring it straight out one inch and then bend it down toward the bottom of the can. Drill a hole just large enough for the wire in the bottom of the can, about 1 1/8 inches in from the outside edge of the bottom. Pass the wire through it and solder it from the outside of the can. Do the same for both connectors and make them as symmetrical as you can. What you have now is a simple one-turn loop of wire coming out of the connector and going to the bottom of the can. The two loops will be sort of "looking" at each other from opposite sides of the can.

Your juice cans will probably also have one end removed. You don't need to remove the other end on any of them. Take one of them and drill a hole for a screw in the exact center of the bottom. Screw size is not important - a # 4, 6, 8, or 10 will be fine. Put the screw in the hole from the INSIDE of the can and put a nut on it from the outside. Tighten it reeeeeal good, 'cause once things are soldered together, you'll never be able to get to it again. Now solder the other two cans to this one like before, making one long skinny 18 ounce can. Do the top can bottom side up so when you're done you have the whole thing sealed.

Now drill a hole in the exact center of the bottom of the coffee cans, same size as before, of course. Now place the juice cans inside the coffee cans with the screw protruding out the bottom and put a nut on it and tighten it down. Your #14 wires are now running parallel to the juice cans and should be about 1/2 inch away from them. Again, don't worry about the exact spacing as long as they are both symmetrical.

Now install the variable capacitor on the side of the coffee can so that it makes sort of a "bridge" from the coffee cans to the TOP of the juice cans. Place it halfway around from each connector so that things remain symmetrical. If it is just exactly long enough to reach the juice cans, great! Just solder it directly to them. If it's a little short, use a piece of your #14 wire. If it's too long so that it bumps into the juice cans, just put it so that it is ABOVE the juice cans and run a wire.

Now, do you see what you have? You have a one turn loop consisting of the capacitor, the juice cans and the return through the coffee cans. You have two coupling loops from the coax connectors which couple into and out of the one turn loop. Simple and elegant! Too bad it's so lossy. :-(

To tune it up, just peak the capacitor for max on the s-meter. It should have a nice sharp peak, just what you want. Put the plastic lid on the coffee can to keep any critters out and you're done!

Total cost from even a poor junk box is approximately $0.00. How can you go wrong?

Thanks go to Bryan, KD7LS, who built and used this back in his early ham career and worked a ton of six meter DX in spite of having it in his transmitter line. Wonder how much more he would have worked with the extra 3db.....? Oh well. This wasn't Bryan's design - he got it from some long-forgotten publication of the era and it was very popular for it's time. If anyone knows who the designer was, please post it. I'd be most interested to know.

Good luck to all and here's hoping it fixes your intermod as well as it fixed mine!

73, Bill, W7LZP

Firstly, let me thank all those who replied to my original post. Most helpful.

In answer to the above question, I will be using the phase comparator only. With either output 2 or 3, not the XOR only output, since the divided LO signal will not be a 50% duty cycle.

I'm beginning to be interested in the same thing. I haven't found
any source code yet, other than an example of how to do simple
input and output with the Soundblaster using BASIC. I'm a
programmer, and I'm willing to do some development on this, but
it would be nice to have some information about the various types
of digital transmissions that are broadcast, especially the ones
that are fairly simple (and not encrypted). Can anyone provide
some information about frequencies, data rates, data representation,
and the like? And of course any example programs would help
a lot, too. Thanks.

I've used black magic marker to make heat sinks dark. Paint would add
a significant layer on the aluminium, maybe act like a thermal insulator
even if it radiates whatever heat that gets thru better than bare metal.
The magic marker coating is a lot thinner than paint would be.

Was never sure if the black magic marker-ing really helped or not....

Folks,

I've just exhausted all the opportunities (known to me) for finding the following Motorola IC:-

MC145436P

which is (probably) a hybrid DTMF decoder with audio filter, time base and TTL-level output.

Any suggestions of outlets (either US or UK) which carry this part would be most appreciated.

We would like to modify some Motorola UHF PBR2000 Tone and Voice pagers
to the UHF Ham band for usage by our Club members.

We already changed the crystal and got one working on 448.275 MHz.
We now have a small "birdy oscillation" in the background and would like
to get ride of it. To do so, we would like to have a copy of the manual and
fine tune the unit.

The complete Motorola model number of the pager is: A04BGC2568A and
the required manual number might be: 6881006B15.

We will pay for the cost of the copies and if you know a source for more
of these used pager, we would like to buy more.

Thank you very much, 73 de Clem. VE2HQJ

I used a 1930s Welch mechanical pump, which frankly isn't a terribly good choice. I bet, though, that if you constructed a design, your local neon signal company would be happy to pump it down for you. It doesn't have to be a perfect vacuum to work, although it certainly never hurt.

>All this high tech is bad for home-brewing :-) Every once in a while

Actually, I like all this high tech. You can get a complete frequency synthesizer on a chip from your local TV repair place... half of your wideband receiver is already designed for you if you scrap a varactor tuner out of a TV set. What I don't like is how poorly documented so much of this high tech gear is.

>: than 50w to the load. How do you explain that?
> The full power is being transferred, however the voltage does
>drop across the load, by 3db.

Thank you for playing, but this was a trick question. The correct answer is:
the transmitter impedance is _not_ 50 ohms. Someone else on this thread
nicely explained loadline impedance, so I'll attack it from the other end:

In an ideal class C amplifier, the active element is either fully off or
fully on. When it is fully off, its impedance is (of course) infinite;
when it is fully on, its impedance is 0. When is its impedance 50 ohms?

That's another trick question, as I hope you realized; the answer is
"never". No, the output matching network does not translate the active
element's impedance to 50 ohms -- *which* impedance is it translating to
50 ohms, infinity or zero?

What you are thinking of is a "signal generator", which is a device that
actually has an analytical output impedance*. For a good discussion of
the difference between a "signal generator" and a "transmitter", get a
copy of Walt Maxwell's book "Reflections".

73, John, WB7EEL/1

* Note that one can (and often does) make a signal generator by taking a
transmitter and following it with a resistive pad (T or pi), whose sole
purpose is to enforce the 50-ohm source impedance regardless of the actual
instantaneous impedance of the actual transmitter.

Tom,
Not sure if you know, but there is a program that captures and decodes
CW (morse code) with a SB, and there are also programs decodeng digital
data (RTTY, Packet, et c.) by directly feeding the audio to the
serial port. How it works? the port generates an interrupt upon
zero crossings and the computer measures the time intervals
and so reconstructs the transmitted audio and code.

The programs are PD.

Personally I would be very interested in a program decodeng transissions
using a SB. May be you find information on codes in the ARRL Handbook.

Success, bye for now, Moritz DL5UH

Hi Ray, the Mini-Circuits manual lists the Output Return Loss of the MAR-4
at 100MHz as -4.73db, 0.58@-24deg. Looks like the SWR will be neither infinite
nor 1:1. I suspect it will be between 2:1 and 6:1 at 100MHz.

An easier experiment would be to take an average 100w transmitter, back it
down to minimum output into a 50 ohm coax section with a dummy load. Measure
the forward power with a 50 ohm dummy load and measure the forward power with
a 100 ohm dummy load. If the forward power reading increases with the 100
ohm load with no increase in input power then the delta increase is the
power being reflected by the transmitter.

As someone else pointed out, if the transmitter has a built in antenna tuner
or a tunable pi network output then a conjugate match will be achieved and
almost all of the reflected power will be re-reflected.

More likely, a current source, as the output impedance of a transistor
is usually higher than the load impedance. For example, a 12V 100 Watt
exciter transforms the 50 ohm load down to 1 ohm or so. The output impedance
of the transistor is considerably higher than 1 ohm.

Actually, the output impedance could look like a low dissipation capacitor
or a low dissipations inductor of any value. Any point near the
unit circle of the Smith chart will do (near infinite VSWR).

Check the specs on the MAR-4. The output impedance is a "nominal" 50 ohms,
but actually departs from it considerably. Most of these amplifiers have a
3 to 1 output VSWR spec. So the output impedance may be as high as 150 ohms.

I agree with Rick that most ham transmitters are likely to look like a
fairly high impedance source (compared with 50 ohms), but if the final
amplifier uses feedback, this can be altered quite a bit. I don't know if
any are actually fairly close to 50 ohms. They COULD be designed this way,
but if you read between the lines of Rick's second paragraph, you realize
that this is really a bad thing. This is because the reflected wave would
be all absorbed in the transmitter, and it would cause heating somewhere,
most probably in the output active devices. Whether you think in terms of
the reflected wave being absorbed in a resistance or a change in the load
line, the answer comes out the same. If the output causes a very high SWR
for the reflected wave, that's a GOOD thing because it means that reflected
wave can't be dissipated in the transmitter and will instead be sent back
down the transmission line for another try at dissipating in the load (with
a little lost in the line along the way). BTW, if you think that a high
SWR can't cause high dissipation in the final amplifier, consider a load
line that is completely reactive: that is, the load line becomes a circle.
Or consider a load that reflects to the active devices as a short circuit,
a vertical load line. If the load is bad enough, even a transmitter that
tries to re-reflect the reverse wave will end up eating it.

Source record: 115816

Before you go and paint your heatsinks black, remember that radiation heat transfer is usually pretty insignificant at temperatures below a few hundred degrees F compared to conduction and convection. The thermal conductivity of enamel paint is pretty low compared to the base aluminum. While aluminum oxide (produced by anodizing) is a fairly good thermal insulator, the layer needed for electrical insulation is so thin that it causes little increase in overall thermal resistance. Also remember the fins on heat sinks are there because the thermal conduction of the aluminum is far greater than the natural convection heat transfer from the surface.

If you really want to enhance a heat sink's performance, mount it so both the sink and the fins are vertical. Mounting the sink vertically with the fins horizontal provides poor natural convection; it will be better to mount the sink horizontal with the fins vertical. If you really need lots of heat dissipation, use a fan for forced convection on the fins. [And for exceptionally high dissipation, consider boiling/vapor cooling, i.e. the Eimac 4CV1500B that never seemed to catch on.]

I don't know if you'd want to do any actual _jamming_.....

But if the country western music is coming from an FM station, a low power FM transmitter that happened to be on the same frequency would come in on the radio.... Because FM is affected by the capture effect, where the strongest signal on frequency is detected by the FM receiver, you could get interesting results with a legal, low power FM transmitter. Try a FM transmitter kit (available from your local electronics store, or the back pages of many electronic magazines).

Of course, for even more interesting results, you might try an FM "bug" on the same frequency. Placed nearby, it would set up a rather severe feedback loop that would result in a howling you wouldn't believe.

Of course, you _could_ just ask the owner of the C&W music machine to turn it down or use headphones... Naw, I guess that's already been done.

Of course, if the radio is AM, things are a bit different, though the hetrodyne squeal of a nearby transmitter, even legal, low power could be rather distrubing.

One of the main problems with this sort of approach, besides the legal\ implications if things get out of hand, is the liklihood the offending radio just gets moved to another frequency, or magically turns into a tape machine or CD player. Short of destructive measures, there's little you can do about them, if requests to the individual or manager fall on deaf ears...

Wishing you the best in your efforts....

Cecil,

Although the discussion gets beyond the intentions of the initial
posting, I should like to continue..

I thought of the same experiment, than again we all know that foreward power
readings change under mismatch.
Now, if you use a well defined 100 Ohms load and different known lengths
of line (low loss) between TX and the load,
and the meter is nice and accurate (the difference of two inaccurate
values is more inaccurate), it should be possible to work out exactly
how much and at what phase power is reflected from the TRX.

(I did)

However, heatsinks don't only lose heat by radiation - they also
conduct it to air, circulated either forcibly or by convection.

I don't know what the relative heat losses by various methods are,
but I suspect the emissivity doesn't tell the whole story - improving
emissivity by a factor of 15 probably doesn't reduce the thermal
resistance by the same order (especially if some of the emitting
surfaces face each other - black surfaces absorb more radiation, too).

> antennas?

This should work fine if you are using dipoles (or short yagis) with a
broad radiation angle. A phase error of a few degrees would only shift
the combined radiation pattern with a few degrees, which can be compensated
by turning mechanically by a few degrees.

However, if very narrow beam antennas are used, the phase error must be
kept so low that the peak of the combined radiation pattern is within
the radiation pattern of an individual antenna. In this case, it makes
more sense to use Wilkinson combiners and splitters as quite a lot
of differential phase shift is required until it will cause even
0.5 dB loss and the radiation pattern is only affected by the power
divider at the antennas.

If the power amplifiers are are designed for narrow band operation
with a lot of high-Q band-pass sections, there is going to be a lot
of (differential) phase variations near the operating frequency due
to component tolerances. If more wide band amplifiers are used with
only low-pass filtering to reduce harmonics, the risk for differential
phase response is smaller (and the amplifier efficiency is lower).

If you can afford 4 amps/preamps/antennas, you probably can afford
separate RG-213/U coax runs and combiners for receive and transmit.
You can then separately tweak the phase response for amps and preamps
so that the radiation pattern will coincide with each other and hopefully
with the radiation patterns of each antenna.

If the array is also used for terrestrial communication, it might be
quite challenging to tweak the amps high above tree tops :-)

The confusion about input and output impedance of
RF amps prompted me to perform the experiment proposed, although
using a MAR-7 rather than a MAR-4.

It *does* have a 50 Ohm impedance looking back into the output.

As others have pointed out however, this is not commonly the case for
transmitters. Those have been designed to drive a 50 Ohm load, which
says nothing about the impedance you'd see looking back into the
output.

The same problem exists with filters. If you have, say, a low-pass
filter designed for an infinite source resistance and a 50 Ohm load,
what's the load seen by the source? Surely not infinity. In fact,
you'd see the 50 Ohm load below cut-off, and something approaching
a short circuit beyond.

I really think we should get our terminology cleaned up.

Best regards,
Jeroen Belleman

Dear homebrewers,

Digital guy needs help with analog circuit design!

I'm driving a differential input delta sigma a/d converter with the "classic" instrumentation amp using three op amps (two in this case since the signal is differential in and differential out. The gain formula is simple, Vout = delta V * ((2*R2/R1) + 1).

I also want to use the circuit to do some low pass filtering (get rid of 60 Hz), nothing fancy needed because of the characteristics of the converter and very low frequency application (25 Hz). I can't find the formula for determining C1 and don't know how to derive it. Looking at some tables, it appears the gain of the circuit (and therefore R1) affects the cutoff frequency.

Thanks,

Tom Kreyche KG6YJ

Many thanks for the many helpful suggestions. I had intended to take into account the fact that a MAR4is only NOMINALLY 50 Ohms out by finding a frequency at which it IS 50 Ohms. I wasn't explicit on this point. Several correctly pointed out that this experiment only covers the case of what happens to a trasmitter which has a nominal 50 Ohm output. This thread started because of an experiment where the tx end of the line was terminated by a tuner. I'll add that experiment.

Again, thanks for the comments.

The P-channel/N-channel JFET configuration was called a "lambda diode" due to the shape of the negative resistance curve looking like the greek letter lambda. There was also an article in 73 magazine in the 70s I believe. I built one and got it to oscillate to at least 30 MHz. That was several years ago. Negative resistance devices have kind of fallen out of favor due to the proliferation of high-frequency three terminal devices.

I want to learn a little more about radio electronics, and I thought that one way to do it would be to take one or two of the cheapo transistor radios I have lying around (and never used) and attempt to modify them to pick up, say, the 140 or 150 MHz region instead of 88-108. I'm looking for where I might find information of a general nature on simple transistor receivers, and I'm not finding what I expected. What I really thought I'd find was a book on transistor radio repair, but I suppose nowadays you just throw a cheap radio out and buy another for 5-10 bucks.

Anyway, that's the deal -- any pointers to books, magazine articles, personal experience, etc.?

Thanks,
Ed Lieser

3141. THE LITTLE RAZOR BLADE RADIO (UPDATE)

From: burt@teleport.com
Message-ID: <38rro9$p6e@elaine.teleport.com>
Source record: 115828

Hi,
First, I tried Bob Keys' idea of an aluminium foil capacitor, and
the result was counter productive. Maybe i did it wrong?

Then,

I tried Gary Coffman's suggestion of scraping insulation of the coil
and using a slider contact. Well, i used a wire probe instead. Got
some good results. Two stations now: Alternative Rock (strong), and
Sports (weak). But hey, it's growing.
Here is the updated schematic:

The paper clip provides a spring-loaded holder for the
pencil lead. Sand the part of the paper clip where the
lead is attached. This provides some holding ability for the
holder. Lay the lead against the clip and secure the two
parts by wraping them with fine wire, or thread.
You can also use "invisible" tape. Make sure you have a good
firm anchorage for the lead.

The lead should have a good point where it makes contact with the razorblade. The paper clip does *not* make contact with the blade.

I have determined that any piece of carbon steel will serve as a collector. Ordinary ferrous materials will not. The literature says that regular razor blades work better than blue blades.

Use a braided wire probe. For some reason, it picks up much better than a single point.

Scrape the insulation on the coil to reveal a shiny band of bare copper (@@@@@) running the length of the coil.
Touch the probe to various spots on the band. Keep your hand steady!

So far, I've been able to pick up 970KH (strong), and 1520 KH (weak). Who knows what treasures lie ahead. :)

Electrosonic has them...however, they may be out of stock because
supposedly the motorola plant had some major problems...(fire???)
and most rf chips are slow in coming...so i've been told by a
distibutor....any ways, try them....if you can't find an address,
get a hold of me direct...

Electrosonic: in Ottawa, Toronto, Vancouver for sure
throughout the states as well

fill in stuff on the jamming needs

go to a department store that sells kids toys and look for the
microphones for kids that transmit to the radio....
they are usually FM and are really cheap <$5 sometimes.
tune it to the offending station at home and when you get to work,
just turn it on....(reference the 'capture effect' from previous)
the range is usually @ 5-10 metres max but then just non-chalantly
place it behind the guys radio.....

have fun!

> I am looking for a DV28120V FET which should be produced by
> Siliconix, but the local Siliconix dealers don't now this transistor. It is a dual VHF
> power FET which is capable of about 120W HF output.

Siliconix is now owned by Temic, a German company in the Daimler-Benz group. I have the 1994 Temic catalog, and that part is not present. Since you're in Germany, you might contact
a Temic office locally and see if they have a special high-power RF devices catalog. Or perhaps the part is too new (or even unreleased) and not in the standard '94 catalog.

Wish I had better news. I've been looking for a good cheap high-power RF MOSFET myself. Motorola is the only game in town, and they're not cheap. You can use the IRF type FETs (which are designed for switching applications) up to 20M or so with good efficiency. They hardly work at all on 6M, which is what I want to design for.

Sure, a transmitter is nothing more than a large signal amplifier,
and oscillator, modulator, etc but we can ignore the latter items
for our current purposes. The key item is that the amplifier be
working and outputting power. Measurements looking back into a
device not outputting power aren't of interest for this discussion.

>How does a network analyzer work? It sends an RF signal to the device

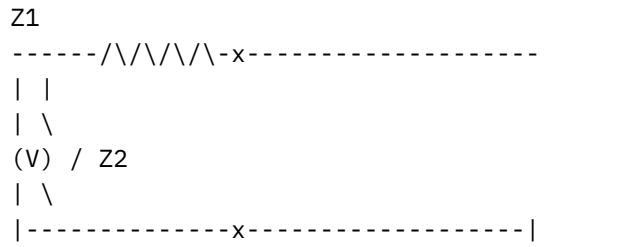
>match. If there is no reflection, the power *is* being disappated
>somewhere!

Not necessarily, or at least in a somewhat unexpected place. Let
me work up to this somewhat slowly so that we all are singing from
the same book. We can model a large signal amplifier in several
ways. I'm going to model it as a voltage source and internal impedance
to start. I'm also assuming that the impedances are all "real", IE they
have no reactive component. We'll call this figure 1.



For ease of illustration, I'm going to assign Z1 and Z2 to be 1 ohm each, and set V equal to 2 volts. This is a "matched" situation with 1 ampere of current flowing, and 1 watt of power being dissipated in each of Z1 and Z2. If we change Z2 to 0.5 ohm, then we have 1 1/3 amperes of current flowing in the loop, Z1 has a voltage drop of 1 1/3 volts, and Z2 has a voltage drop of 2/3 volt. That gives a power dissipation at the load of 8/9 watt, and in the source of 1 7/9 watts. If instead we make Z2 equal 2 ohms, then we have a loop current of 2/3 amp, and voltage drops at Z1 of 2/3 volt and at Z2 of 1 1/3 volt. That gives a power dissipation at the source of 8/9 watt and at the load of 1 1/3 watts.

To sum up, for the matched case we have an efficiency of 50%. In the case of the 0.5 ohm load the efficiency is 32%. And in the case of the 2 ohm load the efficiency is 60%. So it appears that our amplifier efficiency improves when the internal impedance is smaller than the load impedance, *not* identical as in the matched case. This has real implications for us because we know that large signal RF amplifiers with efficiencies greater than 50% exist, and are in common use every day at transmitter sites all over the world. We can safely conclude that these transmitters do not have matched real impedances in source and load.

Ok, what about reflections? In the case above I'm implicitly assuming that the "line" to the load is chosen to be the same impedance as the load in each case to prevent a mismatch. I could have alternately assumed the line was infinitely short so that the waves would have no place to stand. :-)

But now lets consider that the line impedance is a nominal 1 ohm so that we'll have a reflection if the load is not 1 ohm also. Note we'll assume the line is lossless, IE the impedance is imaginary or purely reactive. In the matched case there is no difference. But in each of the other cases there is a 2:1 mismatch at the load.

In both cases, a current pulse will flow back down the line toward the generator. If we assume the forward current has a positive sign, this reflected current pulse will have a negative sign. When this current pulse reaches Z1, it will appear as a discharged reactance at point x. This will cause a correspondingly larger current to flow through the impedance from the source to cancel it. That larger current will cause a larger voltage drop across Z1, and cause a larger power dissipation in Z1. This is what we would expect. Note the extra power being dissipated in Z1 is *from the power supply*, not from the reflection.

Now that assumes that Z1 is a real impedance. If Z1 is a reactive impedance, the situation changes. Depending on whether the load mismatch is greater than the line impedance or less than the line impedance, the source will see either a capacitance or an inductance. Now if the output network of the source is also reactive, this reflected reactance will be absorbed by the network. If the network is tuned to resonance under these conditions, the reactance, and the current pulse it stores, are absorbed into the circulating currents of the output tank, and are coupled back out toward the load in sum with the next output pulse. This is called conjugate matching, and no reflected power is dissipated by the amplifier. There will be, of course, circuit losses due to the finite Q of the output network, and there will be losses in the line due to it not being a pure reactance in real circuits. However, this is not the same as the reflection being absorbed into a dissipative "output impedance" of the amplifier.

Let's talk a moment about what we mean by "output impedance". We'll use a vacuum tube for this discussion, though a transistor would serve as well excepting it has to be viewed as a current operated device which alters some of the details, but none of the fundamental principles.

The output impedance of a tube is it's *load line*, IE the dynamic E/I plot at it's output terminal. It is not a resistor, though it satisfies the Ohm's Law equation for how E and I would behave if a real resistor were present. The British call tubes *valves*, and that's an apt name for how a tube works. A valve regulates the flow of water from a high pressure point to a low pressure point. It doesn't *dissipate* any water. If you attempt to backfeed a pulse of water through a valve, you merely reduce the flow from the reservoir for a moment, IE you shift the P/V load line of the valve. That can *look like* a resistance, but you don't dissipate any water. All the real effects are on the flow from the reservoir. The same holds true with a tube. The real part of a tube's impedance is tiny, just contact resistance. It's nowhere near 50 ohms with any well designed socket. The imaginary part of a tube's impedance is mainly capacitive, but that can't dissipate power because reactances can't do that, only real resistances can. Electrical pulses backfeeding into a tube's output network simply cause momentarily greater or lesser surges of current to be drawn from the *power supply*. They don't "dissipate" in the tube "output impedance". A tube's output impedance is merely the optimum load that should be applied to the tube at a given plate voltage and bias setting. It's not at all the same thing as the source impedance shown in figure 1. As the examples show, we want that to be as low as possible. That's why power tubes have large contact surfaces, often silver plated.

>with SSB--poor amateur practice).

Class AB1 amplifiers routinely achieve 65% efficiency from DC input
to RF output in VHF TV broadcast service. Tubes certainly aren't
100% efficient, but that's not because of some output impedance
resistor. It's because of contact resistance, back bombardment,
and plain old I^2R losses in the tube structure. Every attempt
is made to minimize these losses. Tube contact surfaces are silver
plated, and made large, tube structure lengths are minimized, and
suppressor grids are used in some cases. Flowing 12 amps at 8 kV
can cause a tube, and cavity, to heat, but not 48 kWs worth.

Hello everyone! I need your help.

I would like to conduct a survey of power-supply owners here on the net.
I will post the results after a week or two if anyone is interested.
Please send any replies privately to me here, or if you have E-mail
access send to "andy.moss@canrem.com". If you have more than one power
supply that's great and I'd love to hear about them all! Okay, here's
what I am looking for:

- Brand of supply and model number (of if you made it let me know!)

- Current rating if you know it

- Briefly why you chose this supply (or these supplies)

- Good and bad things (if any) about this/these supply(ies).

Thank you very much and I do appreciate it!

Cheers!

Andy

The MAR series MMICs aren't representative of normal high power
transmitters of the type used in amateur radio and broadcasting.
Due to it's "no tune" unconditionally stable design, it will look
like 50 ohms looking back in it's output port over a wide frequency
range. It's efficiency suffers because of that, but it's purpose
is not to efficiently produce RF power.

The reason high carbon steel is needed is that it's the ferric carbides
that act as the semiconductor. These are distributed in domains in the
steel, so you have to hunt for a sensitive spot with your cat's whisker
to get best response.

You can use them but they are not what they claim to be. I bought some
Gemni rabbits and found that the transmitter was defective on the first
set. After getting the second set the range was less than expected here
in the house. They will tune from 902 thru 930 Mhz and only get around
100 feet or so. If they have to go thru any metal the range drops dramaticly.
Power output is 1mw.
I know of a ham in southern, Illinios who runs rabbits between him and
his friend 7 miles away. He has mounted his rabbit at the antenna and
uses a 32 element 902 antenna at 110 feet. His buddy run a 60 foot antenna
and has the same setup. Both have gasfet amps at the tower and run amateur
receivers to get a useable signal.

3157. Collins S-line on 30 m.?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-30 16:15:03 UTC
From: pepperb@govonca.gov.on.ca
Message-ID: <1994Oct30.161503.7182@govonca.gov.on.ca>
Source record: 115850

Hello, I was wondering if anyone has had any positive success as putting a Collins S-line station on 30 m. I came across an old Hints and Kinks in a 1983
issue of QST. It said that basically (if I remember correctly) it was a matter of replacing the xtal in the 14.8 position normally used to receive WWV at 15 megs. with the proper (see manual) xtal to get it at 10 megs (then you have 30
meter operation as well as WWV at the 10 meg. freq.). The Hint said no re-tuning or alignment was necessary.
I would like know if this does indeed work, indeed requires no re-tuning etc.
(major at least) and that there is no problem afterward re. attendant harmonics. I ASSUME this should work, since the S-lines and KWMs were used for other freq. for military use, etc.

Thank you,
Brien

I am looking for some variactor diodes which can be used in a frequency doubler or trippler circuit. They have been very hard to find as of late and I am and a group of other HAMS need some to make a doubler or trippler to generate a signal on the 2.4 gig HAM band. We might use a 1.2 gig HT into a doubler to get to 2.4 or use an 800 meg commercial radio into a trippler to get 2.4 gig. We have good luck with the few we have been able to find surplus. Any help you might give us to find more would be very much appreciated.

Chain saw bars, cold chisels, files, etc are all high carbon steel.

3161. HELP: Duroid anybody have rogers' number?

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-31 02:56:08 UTC
From: lascal@cortez.its.rpi.edu

Hello,
I remember some time ago, there was a discussion about PCB
materials useful at microwave frequencies. I'm working on a senior
design project, and looking to find some DUROID type material. (for
some components of a 2304/3456 MHz amateur transverter design).

I got the university support number from rogers from somebody
a while back, but lost it. Could anybody help me out?

thanks so much,
-Lance Lascari WS2B

p.s. anybody have a cheap source of rogers 5880 (0.031") material? (:))

The 1935 copy of "Hints and Kinks for the Radio Amateur" gives complete details on homebrew ribbon mikes. I pretty much copied the design given straight out of the book, although I used modern rare earth magnets for higher output, and halved the width of the ribbon in order to reduce mass.

This issue also has an article on condenser microphone construction, but the design really isn't a good one. If you have access to a good, small machine lathe, check out Williamson's article _A Professional Condenser Microphone_ in the July 1963 issue of Audio. It's surprisingly quiet, even with the tube follower that they describe, and the machine work isn't as bad as you might expect.

3164. QRP transmittor circuit question

Newsgroup: rec.radio.amateur.homebrew
Date: 1994-10-31 15:12:05 UTC
From: mam@cbnews.att.com
Message-ID: <CyJM86.7rz@nntpa.cb.att.com>
Source record: 115852

This is a QRP Transmitter question:

How come some circuit designs have the 'Final' transistor connected
directly to the output filter and on to the antenna,

but sometimes

the output of the final transistor is sent to a coil, which then has
another coiling wrapped over it, and that then goes to the output filter
and antenna?

Is one better than the other? The direct method is certainly easier -
I have a lot of trouble doing coils and inductance and torids.
I want to build a QRP rig, and easier is easier, but better is better,
so If I have to do it the hard way to to it right, I'm willing (although
not anxious.) Any advice on this acrea would be appreciated.

Hi Moritz, I think we all know that forward power readings change
under mismatch _when we are using an antenna tuner_ but the question
was do the forward power readings change when we are using the "50
ohm" output from a transmitter into 50 ohm coax. I think the consensus
is that the output impedance of an ordinary 100w transmitter is
considerably below 50 ohms but greater than zero and, no doubt, complex.
